# Tiki v1.0: "Ras Algheti"

**Documentation and User Manual**

*This page intentionally left blank*

## What is Tiki?

Tiki is a CMS system based on a Wiki, if you are not familiar with CMS systems or Wikis just keep reading we'll explain. Tiki is designed to be international, clean and extensible.

## About this version

This is version 1.0 codename: Ras Algheti. This version adds major enhancements to Tiki adding new features: The CMS system , Blogs, Banners and the Dynamic content System. This version is also a bugfix and correction of version 0.95.

Please help us by testing the application and reporting bugs/errors/features and suggestions to the author:

[lrargerich@yahoo.com](mailto:lrargerich@yahoo.com). The home page of Tiki where you can find downloads, report bugs or request features is <http://tikiwiki.sourceforge.net/> Tiki versions are named after popular stars. Ras Algheti is aHercules but it's not the brightest star in the constellation, it's the fifth. Though of the third magnitude this star is magnificent, a reddish supergiant. At a distance of about 400 light years Ras Algheti is a complex double star with a fifth magnitude companion which is in turn a double star. Rasagheti is also a variable start varying it's magnitude in about 1 unit over the years.

## **New features and changes in version 1.0**

- Added blogs to Tiki, users can create blogs, post entries in blogs, find entries, etc.
- The calendar can be now used to navigate blogs watching the posts for a given day.
- Added an XMLRPC interface compatible with blogger, users can use desktop applications such as blogbuddy or blogger to send posts to weblogs.
- Added a CMS system to Tiki, topics and articles can be edited and published or programmed to be published.
- Added submissions to Tiki, users can send submissions, admins can approve them and make them articles.
- Improved the search engine, now you can search in pages, galleries, images, blogs and/or articles, added pagination to the search results page.
- Added an option to select the home page of the application, it can be the Wiki HomePage, a blog, the articles homepage (listing last n articles) or an Image Gallery.
- Make the main application menu expandable/collapsible per section.
- Added banners (Beta version) admins can add banners classified in zones, a banner can be displayed in any template using a simple syntax (including user modules) banners can display HTML code, an image or text (text adds) a page with banner stats accessible by users (clients) is also available
- Templates can now be edited from Tiki
- Added a dynamic content system, this allows to edit blocks that can be included in any template or user module using a simple syntax. Blocks can be programmed for the future and are automatically changed by Tiki. This feature adds a lot of flexibility to the application.

## **Introduction**

Welcome to Tiki 0.95! the most advanced Wiki-System ever. The Tiki-Wiki incorporates all the features present in several excellent wiki systems available today plus a lot of new features and options allowing your wiki application to be whatever you want it to be, from a simple wiki to a complex weblog for a whole user community.

## **Tiki Features**

### ***The Wiki***

The Wiki is a collaboration environment where the users can edit the pages they read. Links to wikipages are created automatically using capitalized words smashed together. A special editing syntax is used to provide features such as bold text, images, external links etc. A history is kept for each page so admins can view diffs and rollback a page to a previous version if a user breaks a page. Wikis can be used for documentation, support, intranets, and many other uses. The Tiki Wiki system has all the normal features Wikis have plus a lot more.

### ***Image Galleries***

Image galleries are collections of images, users can create galleries and upload images to their galleries or public galleries. You can select the number of thumbnails to appear in rows/files of galleries as well as the thumbnails size. Thumbnails are automatically created by Tiki, you don't have to upload them. Galleries can be used for albums, stories, showrooms and many other applications.

### ***Articles and submissions***

The articles & submissions system allows editors to publish articles, articles can belong to a topic and topics can be administered, the articles can use an image or the topic image, you can set up the publishing date of any article allowing you to program articles for the future. The article content can use the Wiki syntax or regular HTML. Links and images in articles are automatically cached to prevent content that resides in other pages from disappearing from your articles. The CMS system has also submissions, users can send 'proposed articles' as submissions and the editors can edit the submissions, remove them or approve them becoming articles. There's a home page where the last "n"

articles are shown. With this CMS system you can easily set-up a site like you did using systems such as PHPNuke or PostNuke.

## ***Blogs***

Blogs are great and they are ver popular today of course we have blogs ☺. A weblog is a collection of “posts” ordered by date, it’s like a Journal on the web. A post can be a comment about something the user did, a review, a thought, anything. The Tiki Blogs system is quite powerful, users can create blogs and of course post entries into their blogs or public blogs. If you want you can choose a Blog and make it appear as the home page of the site. Tiki also implements the Blogger XMLRPC interface allowing you to use applications such as wBlogger or Blogbuddy to manage and edit weblogs.

## ***Banners***

Some time ago banners were used to generate revenues for succesful websites, today this practice is not that frequent but banners are still popular. Why? Because they are a great way to generate traffic for a web site, community sites, weblogs, e-zines and many sites can use banners and interchange banners with other sites to generate more visitors, more pageviews and more traffic to their sites.

This version of Tiki incorporates the first stage of the banners system, it support image banners, HTML banners (used in banner exchange sites) and TextAdds. Banners are assigned to “zones” in your application. There’re a lot of configurable options for banners such as maximum number of impressions, weekdays when the banner can be displayed, hours, etc. Banner clients are normal Tiki users and they can view banners assigned to them accessing a page where banner stats are displayed. Including banners in Tiki is easy using a very simple syntax in any template or user module.

## ***Dynamic Content System***

The Dynamic Content System (DCS) is a very simple concept, you can edit blocks of HTML code or text from a admin screen and you can display a block in any Tiki template or user module. Updating the block content will update the template. You can also program block content by date storing several blocks to be displayed in future dates. This simple system adds a lot of flexibility to Tiki, you can display anything you like anywhere in the screen and you can set-up portions that can be changed or that change atomatically along time.

The DCS can be used for example:

- To display a quote in the top bar or a user module
- To display news in a user module
- To announce products, chats, news according to time
- To announce any event
- To display sport results or sports information
- Anything!

## Extra Features

- Works with PHP4 even if register globals is off
- Uses CSS to define the look and feel, themes are CSS files
- The generated code is valid XHTML 1.0 transitional
- Windows & Unix compatible
- Easy installation and configuration
- PEAR:DB is used, you can use this application with your favourite DBMs without changing the code
- Templates allow the user to change the look and feel of the whole application (Smarty the PHP template engine is used)
- Automatic – internationalization, translate a language file and use it, language files are automatically generated by a provided script.
- Administrators can edit pages, blogs and articles using full HTML tags
- The calendar can be used to view articles or blog entries for a given day.
- Manage permissions using groups (permissions are assigned to groups)
- Configurable sidebar boxes
- Auto-Caching system for URLs
- Auto capture for images.
- Versioning system for pages where you can
  - Review a page version
  - Rollback a page to a given version
  - Remove unwanted versions or pages
  - Diff different versions of a Page
- Individual permissions for pages can be set-up optionally
- Search engine for Wiki pages, blogs, images, image galleries and articles.
- Rankings for pages, blogs, articles and galleries
- Dump to XHTML of the Wiki.
- Integrated RSS feed describing last changes to the wiki

## Requirements

- PHP 4.2+ [Should work with 4.1+ but not tested]
- A database

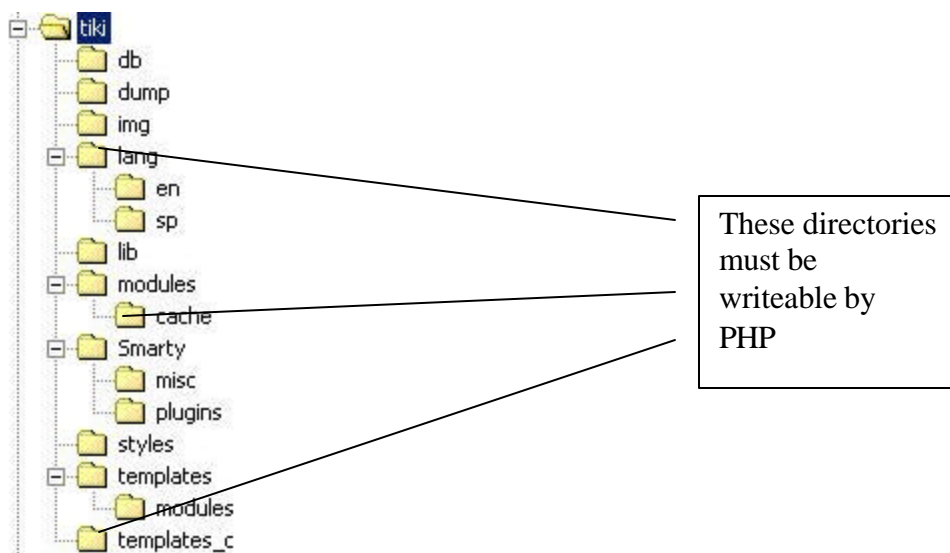

## Optional

- GD library > 1.5 and PHP compiled to use GD (for thumbnails), not needed if you use PHP 4.3+ since GD is bundled.

## Installation

Installing Tiki is easy, first of all you should obtain a distribution of the application, you should already have one if you are reading this file. Tiki can be distributed in several formats, zip, bz, tgz, etc. Unzip, untar or uncompress the Tiki distribution in a directory that can be accessed from your web server. For example /www/htdocs, Tiki will create a tiki directory and put all the files and directories of the application under that directory.

This is the directory structure used by Tiki

## ***Understanding directories***

(you can skip this section if you just want to install and use Tiki)

You can install tiki in any directory and you can name the tiki directory as you want, but you have to respect the internal directory structure of the application since Tiki relies on certain directory names to find modules, images and language files.

The directories contain the following information:

Directory	Description
db	This is where the database connection script is included and the SQL script to create the database is found.
dump	In this directory is where Tiki generates the xhtml dump of the pages to allow users/admins to download a locally browseable version of the Wiki
img	Images used by Tiki
lang	Root for languages
lang/en, lang/sp, etc	Each directory contains a language.php file with the translation of the application strings to the language.
lib	Library files used by Tiki (The Tiki API)
modules	PHP code for modules
modules/cache	This is where Tiki stores cached results from modules
Smarty	The Smarty distribution used with Tiki
styles	CSS files used by the application, each CSS file defines a « Theme » that can be used
templates	Smarty templates for the application
templates/modules	Smarty templates for modules
templates_c	This is where Smarty stores compiled templates (Smarty compiles templates as php scripts)

## ***Configuring the database***

Once all the files are in-place you should create a database for Tiki tables, we'll use MySQL in this example but since Tiki uses PEAR you can use Tiki with any DBMS supported by PEAR: Oracle, Postgress, etc.

Create a database

```
mysqladmin create tiki
```

And then run the tiki.sql script that creates and inits the tables.

```
mysql tiki < tiki.sql
```

You can create a user that will be used by the application to access the database in such a case don't forget to give the database user permission to select, read and write to the tiki database.

NOTE: Tiki tables are named tiki-name and users-\* thus you can make tiki share the database with another application without name-collisions between tables, this is particularly useful when installing the application in a hosting.

Now point your browser to <http://yoursite.com/something/tiki/tiki-index.php> and you should see some page displaying an error message since you won't have permission to access the Wiki yet. If you see a page generated by Tiki then congratulations, you have successfully installed Tiki.

## ***Upgrading the database***

If you have a previous Tiki version and you want to keep the content you have in your database you should use a tiki\_vX.XtoX.X.sql style file to upgrade the database. For example tiki\_0.95to1.0.sql upgrades the Tiki 0.95 database to version 1.0 adding the tables and changes needed to run the new features in version 1.0

If you want to add 0.9 to 1.0 without losing your data upgrade first 0.9 to 0.95 and then 0.95 to 1.0 using the ad-hoc .sql files.

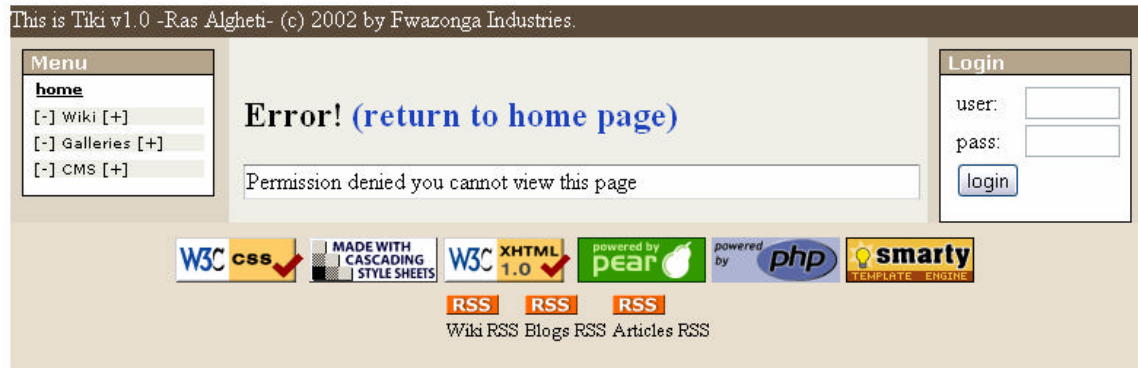

## ***Installation Troubleshooting***

***(read this if all you see is a blank page!)***

If tiki-index.php fails complaining about not being able to include "DB.php" then PEAR is not visible from your PHP installation, Tiki needs PEAR to use PEAR::DB, the database abstraction layer used in PHP. Find the "pear" directory included in your PHP installation and make sure that you have that directory in the include\_path in your php.ini file.

## **Initial Configuration**

Once installed you are ready to configure Tiki to meet your needs, this is the initial screen that will be displayed when you access Tiki:

This page is displaying the Application menu, the login box and an error message since initially anonymous (not logged) users can't view the Wiki pages, the first step in order to be able to configure Tiki is to be logged as admin, log in using the login box as 'admin' using password 'admin'.

You may need to refresh the browser in order to see the Admin menu on the left bar.

Now you can see the HomePage of the Wiki (blank) and you can also see a new module on the left navigation bar displaying the admin menu.

## ***Understanding the application menu***

The application menu is the first menu at the left sidebar:

The menu is divided in three sections here (Wiki, Galleries and CMS), it can also have a Blog section if you have Blogs enabled or an admin section if you are admin or can admin some area of the application). In order to use the menu you should use the [+] and [-] links to expand and collapse sections, if you click [+] in the Wiki section this is what happens:

Now you can see the different links for the Wiki, use [-] if you want to close this section of the menu.

Clicking the "Menu" title will collapse/expand the whole menu if you want. Each section "name" links to the section home if enabled and configured, Wiki will take you to the Wiki page named HomePage, Galleries will take you to a gallery selected as the Home Gallery, CMS will take you to the articles home page and Blogs will take you to the Blog selected as the Home Blog if configured. The "home" link at the first line of the menu takes you to one of the four "Homes" as you selected it

from the admin screen (Yes, the home page can be any of four so you can make important in your site any of the 4 features)

Tiki is now installed and ready to be configured and used, Jump to administration functions in order to learn how to configure users, groups, permissions, modules and features if you want.

# The Wiki

## *Using the wiki*

The Wiki is an environment where users can edit pages as they want adding information, links, lists and images that they find useful, you can use a Wiki as a feature of a users community, a club, a fan site, etc. The most important elements in the Wiki are the Wiki pages.

## ***Creating and Editing Pages***

If you have the appropriate permissions you will see a menu at the bottom of pages with several options and one of them will be “edit”, when you click “edit” you are able to edit the page that you are watching, you can try editing a page and writing some text on it. Use the “preview” feature as many times as you need it before clicking “save”.

In order to create a new Wiki you should first generate a “reference” to the page from an existing page, Wiki automatically generates a reference when you write a word using Capitalized words smashed together, for example ThisIsMyPage or TennisResults or VisitLondon, when Wiki first sees a reference the page will display the name followed by a “?”, let’s see an example.

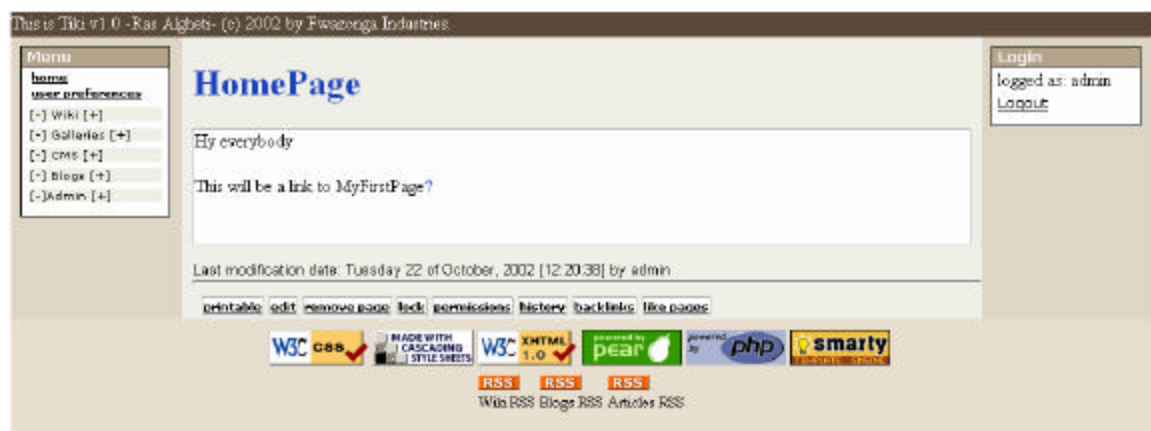

We’ll edit the home page.

Access the home page and click “edit” at the bottom of the page.

Write some text making sure you use the word MyFirstPage, save the page using “save”. Use the preview button if you want to preview how the page will look like once edited.

After saving you will se something like this:

As you can see there's a “?” question mark following MyFirstPage, this indicates that MyFirstPage is referenced from this page but has no content (it was never edited) so the “?” question mark is a link to “edit” the page. Click the question mark and edit the page.

Save the page using the save button and you will see:

Click the “home” option in the menu to return to the HomePage, this will be displayed:

As you can see MyFirstPage is now displayed as a link, if you click on it you will access MyFirstPage viewing the content you just edited.

This is how new pages are created and edited and how the Wiki is navigated, as you can see creating pages is really easy and that's why Wiki's are populated at a very high speed rate by their users adding pages and content as they need.

If you want to know what kind of features you can use when you edit a page visit the Wiki Tag System section where you will learn how to use titles, lists, images etc.

## Wiki Menu

Now let's examine the options available in the Wiki Menu:

<a href="#">[-] Wiki [+]</a>
<a href="#">home</a>
<a href="#">last changes</a>
<a href="#">dump</a>
<a href="#">rankings</a>
<a href="#">list pages</a>
<a href="#">sandbox</a>

- Home (go back to the Wiki HomePage)
- Last Changes (see last changes)
- Rankings (see several rankings)
- Dump (download a dump of the wiki)
- List Pages (listing of wiki pages)
- Sand Box (test page to practice editing skills)

Note: All the features can be enabled/disabled from the admin menu

## Last Changes

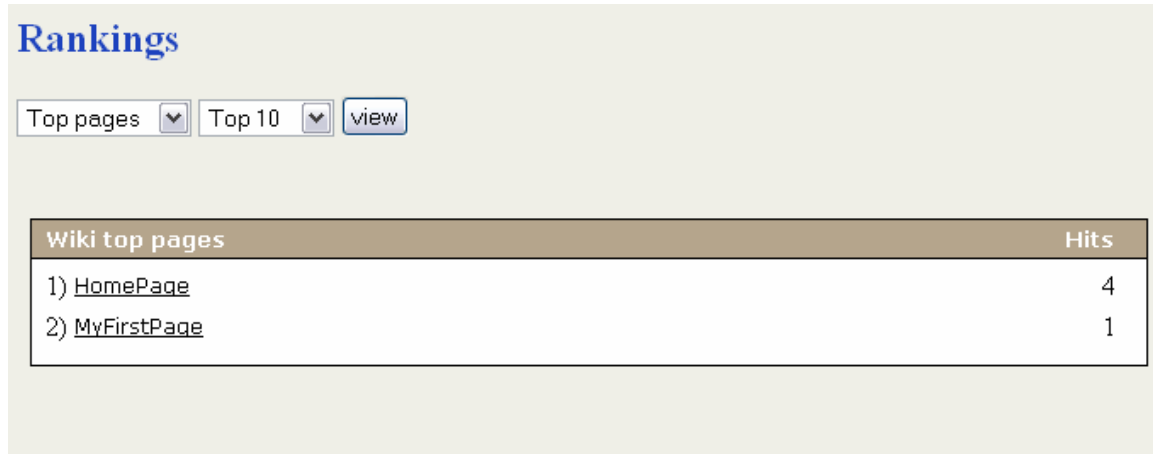

The last changes screen can be used to see what happened to the Wiki recently (or not so recently), as you can see the information is displayed in a tabular way indicating for each change the page and action, the user that changed the page an Ip for that user and the comment (if entered).

Last Changes					
<a href="#">Today</a>   <a href="#">Last 2 days</a>   <a href="#">Last 3 days</a>   <a href="#">Last 5 Days</a>   <a href="#">Last Week</a>   <a href="#">Last 2 Weeks</a>   <a href="#">Last Month</a>   <a href="#">All</a>					
Date	Page	Action	User	Ip	Comment
Thu 17 of Oct, 2002 [12:45:56]	<a href="#">MyFirstPage</a>	Created	admin	192.168.0.56	some test
Thu 17 of Oct, 2002 [12:44:14]	<a href="#">HomePage</a>	Updated	admin	192.168.0.56	my first page
Page: 1/1					

In our example you can see that we updated "HomePage" and then we created "MyFirstPage". While this screen can be used by anyone wanting to see what happened recently it is also a great tool for admins to check what is happening in the Wiki without having to check if page. The links above the table allows you to select the period of time

you want to cover. Pagination is used so clicking “all” won't destroy the server but you may have to navigate a lot of pages.

## Rankings

The screenshot shows a web interface titled "Rankings". Below the title are two dropdown menus: "Top pages" and "Top 10", followed by a "view" button. Below these controls is a table with the following data:

Wiki top pages	Hits
1) <a href="#">HomePage</a>	4
2) <a href="#">MyFirstPage</a>	1

The rankings screen can be used to see several “charts” or rankings about the Wiki, you have to select the ranking you want to see from the select box and you can select if you want to see the Top 10, 20, 50 or 100 results. Clicking “view” displays the ranking. The rankings that you have available may depend on the Tiki version you are using since one of the things that we may add in new versions is new rankings. Check it out!

## Dump

The Dump link is a link to a Dump of the Wiki (if the Dump was created from the admin screen) this will download a .tar file containing a xhtml representation of the pages in the Wiki.

## List Pages

# Pages

Page	Hits	Last modified	Last author	Last version	Comment	Status	Versions	Links	Backlinks	Size
<a href="#">MyFirstPage</a>	1	Thu 17 of Oct, 2002 [12:45:56]	admin	1	some test	unlocked	<u>0</u>	0	<u>1</u>	14
<a href="#">HomePage</a>	4	Thu 17 of Oct, 2002 [12:44:14]	admin	2	my first page	unlocked	<u>1</u>	1	<u>0</u>	49

Page: 1/1

This screen will show you a list of the Wiki pages with some interesting information about pages such as number of visits (hits), who was the last user that edited the page, number of versions in the page. Links found in the page and the size in bytes. This listing can be ordered by any column clicking the column title, note that if you reclick the same column the order is reversed. This behaviour is the same in all the listings in Tiki so we should remark it.

Note: In all the Tiki listings if the column title is a link you can click it to make the listing appear ordered by the selected column, to reverse the order just click again on the column title.

## Sand Box

## Edit: SandBox

The SandBox is a page where you can practice your editing skills, use the preview feature to preview the appearance of the page, no versions are stored for this page.

Allow HTML: ☒

preview

save

If enabled from the admin screen there will be a special page in the wiki named "SandBox" the SandBox behaves like a normal page with the following exceptions:

1. everybody can edit edit the SandBox bypassing permissions.
2. no versions of the SandBox will be stored, the page cannot be deleted, or rolled back.

The SandBox is useful as a practice page where users can practice their editing skills and get used to the WikiTiki editing syntax. Many wikis offer a SandBox as a way to get familiar with the Wiki.

## ***The Tiki pages menu bar***

When you are viewing a Wiki page, a menu bar with some options will be displayed at the end of the page, the number of options in the bar may be different depending on the permissions you have. This is the bar with all the options appearing:

The options are:

- Printable: view a printer-friendly version of the page
- Edit: edit the page
- Remove Page : remove the page
- Lock: lock the page
- Permissions: set page permissions
- History: view the page history
- Backlinks: view pages that link to this page
- Like Pages: view pages similar to this one

So let's examine each option in detail.

### **Printable**

This option will display a printer-friendly version of the page removing menus, sidebars, banners and all that kind of things. It should be nice to provide also a PDF version of each page and we are planning to add this feature in a

future version of Tiki –stay tuned-.

### **Edit**

The Edit button takes you to the edit screen where you can edit Wiki Pages, since editing Wiki pages is the most important feature of the Wiki section we have a special dedicated section in this manual and you can find it after the rest of the page-bar options are explained.

## Remove Page

### Remove page: HomePage (version: last)

You are about to remove the page: HomePage permanently.

Remove all versions of this page: ☐

The remove page option takes you to a page where confirmation is asked. In that page you can remove the

page and if you want you can also remove all the versions of the page. If you don't remove all the versions of the page the next-to-last version becomes the current page. Yes, you should use this feature carefully.

## Lock

The lock/ unlock button is used to lock/unlock pages, when a page is locked nobody can edit the page when until it is first unlocked. This can be used to "lock" some pages that you don't want to be edited by anyone in open Wikis where everybody can edit pages, for example the HomePage in some Wikis.

## Permissions

**"Maybe you should read about the Tiki permission and groups system before reading this section"**

### Assign permissions to page: HomePage

#### Current permissions for this page:

No individual permissions global permissions to all pages apply

#### Assign permissions to thispage

tiki\_p\_view

to group:

Registered

In this page you can assign permissions to this page overriding the global Tiki permission system. The way to use this screen is easy select the permission you want to apply

and then select the groups that will have the permission for “**this**” page. You can remove permissions clicking the remove link once a permission has been assigned.

## History

History of: <a href="#">HomePage</a>					
Date	Version	User	Ip	Comment	Action
Thu 17 of Oct, 2002 [12:44:14]	2	admin	192.168.0.56	my first page	[current_version]
Wed 16 of Oct, 2002 [19:56:37]	1	system	0.0.0.0	Tiki initialization	<a href="#">view</a> <a href="#">remove</a> <a href="#">rollback</a> <a href="#">diff</a>

[printable](#) [edit](#) [remove page](#) [lock](#) [permissions](#) [history](#) [backlinks](#) [like pages](#)

One of the most interesting features of the Wiki is that each time you edit a page the previous version is not discarded but stored in the history. If you have the right permissions you can view previous versions and rollback a page to a previous version if needed. This is how vandalizing is prevented/countered if a page is vandalized it will stay in that state only until a user restores a previous version.

In the history screen you can see all the page versions and if you have the right permissions you will see some options for each version, the options are:

- View: view any version of a page
- Remove: remove a specific version of a page
- Rollback: rollback a page to any version
- Diff: view a diff between any version and the current version

## View

View will show you that version of the Page.

## Remove

### Remove page: HomePage (version: 1)

You are about to remove the page: HomePage permanently.

Remove all versions of this page: ☐

[remove](#)

Remove can be used to remove a version, you will be asked for confirmation before removing a version.

## Diff

### History of: [HomePage](#)

#### Diff

Actual\_version

Version:1

Hi everybody

This is a link to [MyFirstPage](#)

Diff shows a diff between the actual version of the page and the version you selected.

## Rollback

Rollback is used to revert a page to a given version. You will be asked for confirmation before rolling back a page to a previous version.

The rollback option can be used if you don't like the current version of a page and want to switch to an older version, an alternative is to remove all the versions that you don't like until the desired version becomes the current one.

Note: If you want a feature to do a “massive” rollback of several pages you may want to read about “Tags”, you can find about tags in the Admin section.

## Backlinks

backlinks to **MyFirstPage**:

**HomePage**

Backlinks are links from any page to the current page (the page you are reading), you can use the backlinks option to see which pages are linking to a particular page and find

“orphan” pages, pages with no backlinks. Orphan pages are likely to get very few visits if any and in many occasions orphan pages are old pages that were removed from the Wiki and you may need to delete them.

## Like Pages

Like pages show a listing of pages named similar to the current page. As you know a page is named using CapitalizedWordsSmashedTogether, “like pages” show pages where one of this smashed words is the same as one of the words in the current pages. For example “MyPage NFLResultsPage OpinionsPage” are similar because they share the word “Page”.

## Editing Pages

**Edit: MyFirstPage**

This is a test

Comment:

Allow HTML: ☒

preview

save

Editing pages is the most important feature of the Wiki. The edit screen allows you to edit a page, preview the page as many times as you want and then save it. To edit pages you use a special syntax common to many Wiki systems that is called “The Wiki Tag System”, this will allow you to use bold text, italics, images and many other things in your pages. If you have the permission you may also use regular HTML

code in your Wiki pages thus permitting a page to be anything you want to be. IF you have permission to use HTML you should be able to see a checkbox labeled "Allow HTML" at the bottom of the page. The checkbox is enabled by default, if you uncheck it then HTML tags will be removed when saving the page.

Now let's understand the Wiki Tag System.

## The Wiki Tag System

The wiki-tag system is the "language" you can use when you edit wiki pages, there's a common set of features that are usually present at all wikis that Tiki maintains and some special features not frequently found in Wikis that Tiki adds.

You have a quick-reference to the wiki-tag system available at the bottom when you edit a page in the Wiki.

### TextFormattingRules

**Emphasis:** " for *italics*, \_\_ for **bold**, " \_\_ for ***both***

**Lists:** \* for bullet lists, # for numbered lists, ;term:definition for definition lists

**References:** JoinCapitalizedWords or use square brackets for an external link: [URL] or [URL|link\_description].

**Misc** "!", "!!", "!!!" make \_headings, "----" makes a horizontal rule

**Title\_bar** ".=title=" creates a title bar.

**Images** "img src=http://example.com/foo.jpg width=200 height=100 align=center link=http://www.yahoo.com desc=foo}" displays an image height width desc link and align are optional

**Tables** "%row1-col1&row1-col2&row1-col3\rrow2-col1&row2-col2&row3-col3%" creates a table

## Normal text

Normal text is just entered as-is.

## References to other wiki pages

References are created when you use capitalized words smashed together, if the page exists a link to the page will be shown, if not a link to edit the page will be displayed.

ThisIsaReference

## Links to external pages

Links to external pages can be entered using one of the following formats:

```
[http://www.somesite.com]  
[http://www.somesite.com|This is a nice site to visit]  
[http://www.somesite.com|Hey|nocache]
```

The first format will display the URL as a link while the second one will display the description as a link to the given URL. The third syntax can be used to prevent the link to the cache from being displayed in the page.

Tiki will automatically cache references to external pages or sites and a link to the cache will be displayed following the link, this is particularly useful when you link to notes or sections that may change or that may disappear in a near future. (Very similar to the google cache when you see the results of a search in google). You can disable caching pages from the admin screen.

## **Bold and italic text**

Bold text can be entered using two underscores before and after the text.

```
__This is text in bold__
```

Italics are displayed using two quotes before and after the text

```
''this will be displayed in italics''
```

## **Lists**

### **Bullet lists**

Bullet lists are automatically created when you prefix a line of text with an asterisk "\*" (as you do when using Word for example)

### **Numbered lists**

Numbered lists can be entered prefixing each line in the line with a hash mark "#"

### **Definition lists**

Definition lists can be entered using the following format:

```
;term1:definition1
;term2:definition2
etc...
```

## Monospaced text

Monospaced text can be used to show portions of code or text that needs to be properly aligned (ASCII art anyone?). To enter monospaced text prefix each line of text with a blank space. Lines starting with a blank are displayed in a courier monospaced font.

## Using tables

You can create rudimentary tables using Tiki, a table can be entered using the following notation:

```
%row1column1&rowcolumn2&row1column3\row2column1&row2column2
&row2column3%
```

Note: % delimites the table, & delimites cells and \ delimites rows.

## Including images in your pages

Images can be included using regular HTML code if you have the permission or the Wiki syntax for images explained here:

Images can be included in a Wiki page using the following syntax

```
{img      src=http://www.something/image.jpg      width=100
height=100 desc=foo align=center link=http://site.com}
```

Where only src is mandatory and the rest of the attributes are optional. Note that you mustn't use quotes for the attribute values. The attributes are:

src	URL for the image
height	Image height
width	Image width
align	can be center, right or left
desc	Image description to be displayed below the image
link	an URL to make the image link to that URL

If you include an image from a URL Tiki will automatically “capture” the image and replace the link to an internal database-stored version of the image, that allows images to persist in the pages even if they are removed from the remote servers that originally had them. (You can disable this feature from the admin screen)

**Important TIP:** If you have the image cache enabled but don't want to cache some image (for example you want to display an image that changes along time) add a nocache option to the image src.

Example: ` | <input type="button" value="find"/> |               |      |        |      |         |
|------------------|----------------------|-------------------------------------|---------------|------|--------|------|---------|
| Name             | Description          | Created                             | Last modified | User | Images | Hits | Actions |
| No records found |                      |                                     |               |      |        |      |         |

Page: 1/0

## Creating a gallery

If you click in the “create gallery” link a screen with a form to create a new gallery will be displayed:

### Create or edit a gallery using this form

Name:	<input type="text"/>
Description:	<input type="text"/>
Max Rows per page:	<input type="text" value="10"/>
Images per row:	<input type="text" value="6"/>
Thumbnails size X:	<input type="text" value="80"/>
Thumbnails size Y:	<input type="text" value="80"/>
Other users can upload images to this gallery:	<input type="checkbox"/>
<input type="button" value="edit/create"/>	

The fields are explained in the following table:

The fields are described as follow:

Field	Description
Name	The gallery name
Description	The gallery description
Max Rows per page	Maximum number of rows of thumbnails that will be displayed when someone visits the gallery.
Images per row	Maximum number of thumbnails per row when visiting the gallery.
Thumbnails size X	Width for Thumbnails
Thumbnails size Y	Height for Thumbnails
Other users can upload images to this gallery	If checked then other users can upload images to your gallery, they won't be able to delete images or change the gallery.

Create a gallery for testing if you want, we'll use it in the next sections.

<b>Available Galleries</b>							
Find	<input type="text"/>	<input type="button" value="find"/>					
Name	Description	Created	Last modified	User	Images	Hits	Actions
Test	This is a test gallery.	Thu 17 of Oct, 2002 [15:05:13]	Thu 17 of Oct, 2002 [15:05:13]	admin	0		<a href="#">Edit</a> <a href="#">Remove</a> <a href="#">Upload</a> <a href="#">Browse</a> <a href="#">List</a>
Page: 1/1							

After creating a gallery you can see the options you have in the listing (again options may vary according to permissions), the whole package of options is:

- Edit: edit the gallery information
- Remove: remove the gallery
- Upload: upload images to the gallery
- Browse: browse the gallery
- List: gallery listing

## Edit

Actions
<a href="#">Edit</a> <a href="#">Remove</a> <a href="#">Upload</a> <a href="#">Browse</a> <a href="#">List</a>

Edit will allow you to edit the gallery using the same form you used to create the gallery, you can change the gallery information here, size of thumbnails, etc. Note that changin the size of the thumbnails doesn't actually rebuild the thumbnails, you must use

the rebuild thumbnails option when browsing the gallery to rebuild them.

## Remove

Remove will remove the gallery and all the images in the galleries, this won't ask for confirmation, all the galleries and images will be gone so use it very carefully.

## Upload

This option will take you to the upload image screen that is explained later.

## Browse

The browse option can be used to browse the gallery, when you browse a gallery you will see thumbnails for the gallery images. We'll show you an example of browsing a gallery after we explain how to upload images to the gallery.

## List

List is a non-graphical representation of a gallery instead of thumbnails for each image you will see a listing with one row per image, if you want to delete images or take a quick-look at a gallery content without viewing the images you may want to use "list" instead of "browse" since listing is faster than browsing the gallery.

## *Upload Image*

The Upload image screen let's you upload images to galleries.

# Upload Image

Image Name:

Image Description:

Gallery:

**Now enter the image URL or upload a local image from your disk**

URL:

Upload from disk:

The fields are self-explanatory, note that you have to select a gallery where the image will be uploaded, you can upload images to galleries you created or public galleries created by other users(!).

There're two ways to upload images: entering the image URL or uploading an image from your disk, the upload screen admits both formats but you should use only one method for each image. (If you enter a URL you don't have to upload and if you upload you don't have to enter a URL). If you use both then the result is unpredictable.

If everything goes fine the image will be uploaded and you will see the image and the thumbnail displayed.

For example:

**Upload succesful!**

**The following image was succesfully uploaded:**

**Thumbnail:**

You can view this image in your browser using:

[http://luigi.melpomenia.com.ar/tiki/tiki-browse\\_image.php?imageId=2](http://luigi.melpomenia.com.ar/tiki/tiki-browse_image.php?imageId=2)

You can include the image in an HTML/Tiki page using ``

The image was uploaded and stored into the Tiki database!

You will see the image, the thumbnail and information about how to browse the image and how to include the image in an HTML page or a Wiki page. Keep this links in mind since you may want to upload some images to a gallery that can later be used in your Wiki pages or in your Blog posts. Uploading images to a gallery is a nice way to keep images stored in the Tiki system so they won't fail if a site that held them goes offline or removes the images.

If you see the thumbnail with the same size as the image then: if the image was a GIF file this is normal, don't worry, if the image is not a GIF your PHP installation doesn't have the GD extension or the GD extension is too old, in such a case thumbnails will be generated resizing the original image.

**Uploading Images reminder:**

Note: You can upload images to:

- 1) Galleries created by you
- 2) Public galleries (galleries with the public option set)

## ***Browsing galleries***

Once you have some images uploaded you may want to browse the gallery you created:

### Browsing Gallery: Test

[edit gallery](#) [rebuild thumbnails](#)  
[upload image](#)  
[list gallery](#)

This is a test gallery.

Sort Images by [Name](#) [Date](#) [Hits](#) [User](#) [Size](#)

	
Some image <a href="#">[x]</a> (228x140)[ hits]	Some image <a href="#">[x]</a> (800x600)[ hits]

The browse gallery screen displays the thumbnails, the gallery description and links to edit the gallery, rebuild the thumbnails and upload images (if you have the right permissions). The [\[x\]](#) link can be used to remove an image from the gallery if you want.

There're options to sort the images in the galleries by Name, Date, Hits, Size and User if you want a different order (clicking the link again will reverse the ordering)

For each image a thumbnail is displayed showing the image title, it's size and the number of hits (a hit is computed each time the image is browsed). If you click on the image you will browse the image:

## Browsing Image: test

[return to gallery](#)

Image Name:	test
Created:	Thursday 17 of October, 2002 [15:31:04]
Hits:	3
Description:	test
Move image:	<input type="button" value="Test"/> <input type="button" value="move"/>

You can view this image in your browser using:  
[http://luigi.melpomenia.com.ar/tiki/tiki-browse\\_image.php?imageId=3](http://luigi.melpomenia.com.ar/tiki/tiki-browse_image.php?imageId=3)  
You can include the image in an HTML or Tiki page using ``

In the browse image screen you will see the full image, the image information, an option to move the image to another gallery (if you have permission) and the information on how to link to browsing the image or how to display the image in an HTML page or a Wiki page, an article or a Blog.

## Rankings

### Rankings

Wiki top images	Hits
1) <a href="#">test</a>	4

The rankings screen for image galleries is similar to other ranking screens you can select the ranking to show, the number of results to display and clicking the “view” button will display the Ranking.

## ***The System Gallery***

As you already know if enabled from the admin screen Tiki can capture images referenced from other sites/URLs storing them in the Tiki database. Those images will be stored in a special gallery called “The system gallery” if you are admin you can browse the system gallery and check what images are stored there, and if you want you can also remove images (if they are no longer referenced from user pages). A feature to automatically remove orphan images (images not being used in any page) will be added to future Tiki versions.

## **Articles and Submissions**

Articles and submissions are the most important part of the Tiki CMS system, with the articles and submissions system you can build the basement for a site like those constructed using other CMSs systems like PHPNuke or Postnuke with all the advantages that Tiki has. Basically there’re three structural components for the CMS system: Topics, Articles and Submissions.

The Articles menu:

As a user this is a simple menu, you can visit the Articles Home, you can see a list of articles, you can see the Rankings, send a submission or view active submissions. Of course what you can or can’t do and what you see in this menu is configurable.

If you are admin click the “Edit article” link in the admin menu to enter a new article.

## ***Editing Articles***

This is Tiki v1.0 -Ras Algheti- (c) 2002 by Fwazonga Industries.

**Menu**

[\[-\] CMS \[+\]](#)  
[\[-\] Blogs \[+\]](#)  
[\[-\]Admin \[+\]](#)

## Edit:

[list articles](#) [view articles](#)

Title

Author Name

Topic

Own Image

Use own image ☐

Own image size x

Own image size y

Heading

**Login**  
 logged as: admin  
[Logout](#)

This is the screen where you can edit and existing article or create a new article, we'll examine each field in detail:

Title

Author Name

Topic

Title is the article title, AuthorName is the name of the author as it will appear in the article (you can use any name here). Topic is the topic where the article will belong, if you don't see options in the select box for topics then you must first create a topic, use

the admin topics link in the admin menu to create a topic and then go back to the edit article screen.

Own Image

Use own image ☐

Own image size x

Own image size y

Articles can have an associated image, if you want your article to have an associated image you can upload an image using the Own Image field. By default the article will display the topic image (each topic has an image), if you want the article to display it's own image

instead of the topic image check the "Use own image" checkbox. If you are using the article image you may want to check the size that you will like for the image.

Heading

The heading and the body are self explanatory, note that you can use the

Wiki Tag System here as if you were editing a Wiki Page, read about the Wiki Tag System if you didn't. If you want to use HTML in the article make sure that the AllowHTML option is checked at the bottom.

Publish Date    at

Allow HTML: ☒

At the bottom set the publishing date for the article and verify the Allow HTML

option (if you have permissions), use the preview feature as many times as you want to preview the article and then click save.

We entered a sample article to show you the Articles Home page.

## Articles Home

The Articles Home displays the last “n” articles of the CMS system, “n” can be configured from the admin menu, this page can be set up as the Tiki Home Page from the admin screen if you want to use Tiki as if it were a normal CMS system.

You will see each article displayed showing the heading and a link to read more where you can read the whole article:

## List Articles

The list articles section shows a list of articles.

## Articles

[edit article](#) [view articles](#)

Find

Title	Topic	PublishDate	AuthorName	Reads	Size	HasImg	UseImg	User	Action

Page: 1/1

You will a list of submissions and if you have the permissions yoy may see links to edit, remove or approve a submission. Once a submission is approved it becomes an article.

## The Blog System

Blogs are a very hot topic in the web lately, basiccally a blog is a collection of posts, a blog can be set up as a personal Journal for a user, a set of reviews of movies, comments about sites, news about a product, world news, whatever.

The Tiki Blog system is quite powerful, let's take a look at the menu for blogs in the main menu:

<a href="#">[-] Blogs [+]</a>
<a href="#">List blogs</a>
<a href="#">Rankings</a>
<a href="#">Create/Edit Blog</a>
<a href="#">Post</a>

There're four options in this menu: List blogs, Rankings, Create/Edit Blog and Post. We'll examine each option in detail next.

### Create/Edit Blog

So you want to set up your personal Journal in the web, you should then create a new weblog, the screen will display a form as the following.

## Edit Blog:

[list blogs](#)

Title

Description

Number of posts to show

Allow other user to post in this blog

☐

save

You must enter a title for the Blog, a description, the maximum number of posts to show per page and you have to indicate if you will allow other users (any users) to post entries into this weblog. Normally blogs are private for the user that created the blog but sometimes you may want to allow other users to post entries, you can delete the entries if you don't want them later.

Once a blog is created you can start "posting" to the weblog.

## List Blogs

### Blogs

[edit blog](#)

Find	<input type="text"/>	<input type="button" value="find"/>							
Title	Description	Created	Last Modified	User	Public	Posts	Visits	Activity	Action
My Journal	This weblog shows what I do everyday.	Thu 17 of Oct, 2002 [16:42:03]	Thu 17 of Oct, 2002 [16:42:03]	admin	n	0	0		<a href="#">Post</a> <a href="#">Edit</a> <a href="#">Remove</a> <a href="#">Read</a>

Page: 1/1

In this screen you will see a list of available blogs, if you have the right permissions you may see links to post, edit, remove or read a weblog. Remove will remove the whole weblog and all it's posts so use it very carefully.

## Post

### Edit Post

[view blog](#) [list blogs](#)

Blog  

Data

Posting is how weblogs are populated when you post you have to select which weblog to use (you will see all your weblogs plus public ones available) and you enter the weblog entry. As you can imagine you can use the Wiki Tag System to edit weblog entries and you can use regular HTML too. Since weblogs are normally private initiatives by users HTML is always allowed, if you break your own weblog then it will be your problem.

After posting or clicking a read link in the blog listing or by a link you can “read” a weblog:

## Reading a weblog

### Blog: My Journal

Created by admin on Thu 17 of Oct, 2002 [16:42:03]  
Last modified Thu 17 of Oct, 2002 [16:45:39]  
(1 posts | 0 visits | Activity=2.00) [\[Post\]](#) [\[Edit\]](#)

Description: This weblog shows what I do everyday.

Find:   Sort posts by: [Date](#)

Thursday 17 of October, 2002 [16:45:39] [\[Edit\]](#) [\[Remove\]](#)

This is my first post

Page: 1/1

When you read a weblog you will see all the posts for today or the previous days, you can navigate the posts using the next/prev buttons at the bottom of the page or you can use the calendar module if enabled to browse posts for any given day.

The read screen will display information about the weblog such as number of posts, visits, activity rate and last modification date and if you have the permissions it will display links to post or edit the weblog.

There's a find button that let's you search for posts containing some specific information.

For each post if you have the permission you will see links to edit the post or remove the post.

## ***Rankings***

The screenshot shows the 'Rankings' interface. At the top, the word 'Rankings' is displayed in a blue serif font. Below this, there are two dropdown menus: the first is labeled 'Top visited blogs' and the second is labeled 'Top 10'. To the right of these menus is a blue button labeled 'view'. Below the controls is a table with the title 'Most visited blogs' in the header. The table has two columns: the first column lists the blogs, and the second column is labeled 'Hits'. The table contains one row of data: '1) My Journal' in the first column and '1' in the second column.

Most visited blogs	Hits
1) <a href="#">My Journal</a>	1

The rankings screen for weblogs displays several rankings and charts about the weblogs, you should select the ranking and the number of positions to show and then click the “view” button.

## ***Using Desktop Applications for your Blogs***

One of the great features of Tiki is that it implements the XMLRPC API of blogger, a popular blogger with a lot of tools and users in the market. This API is used by several windows applications that can be used to manage your weblogs, any application implementing the Blogger XMLRPC API can be used to edit Tiki blogs.

Note: The XMLRPC feature should be enabled from the admin screen to make this programs work, the feature is disabled by default so if you are admin and want to use Desktop programs for blogs please enable the feature.

## Using wBlogger

In this section we'll introduce wBlogger a very nice application to manage blogs that can be used to manage Tiki blogs, note that this is not the only application that can be used, any application that you like implementing the Blogger XMLRPC API can be used.

## Installing wBlogger

wBlogger is one of the nice applications you can use to edit Tiki weblogs, wBlogger can be downloaded from: <http://wblogger.com/>. The application is a normal windows application that has a installer, once installed you should configure blogger to access the Tiki database.

## Setting up your account

This is the first screen displayed when you start wBlogger: In this screen you should enter your tiki username and password as you use it in Tiki. Then once in the wBlogger application you should enter file->account\_connection and configure the Tiki server:

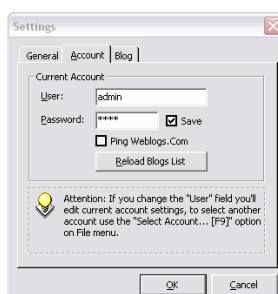

## Setting up the Tiki server

Enter the Tiki IP address or the tiki hostname (for example [www.mytiki.org](http://www.mytiki.org)) in the Host field. Then enter the path to the xmlrpc.php file that is distributed within tiki in the “Page” field, for example: /tiki/xmlrpc.php if you installed Tiki at the Document Root of your server. , the port should normally be 80 unless you changed it and the timeout can be left in 30 seconds. If everything is ok you are ready to use wBlogger to edit Tiki weblogs!

## Getting list of available blogs

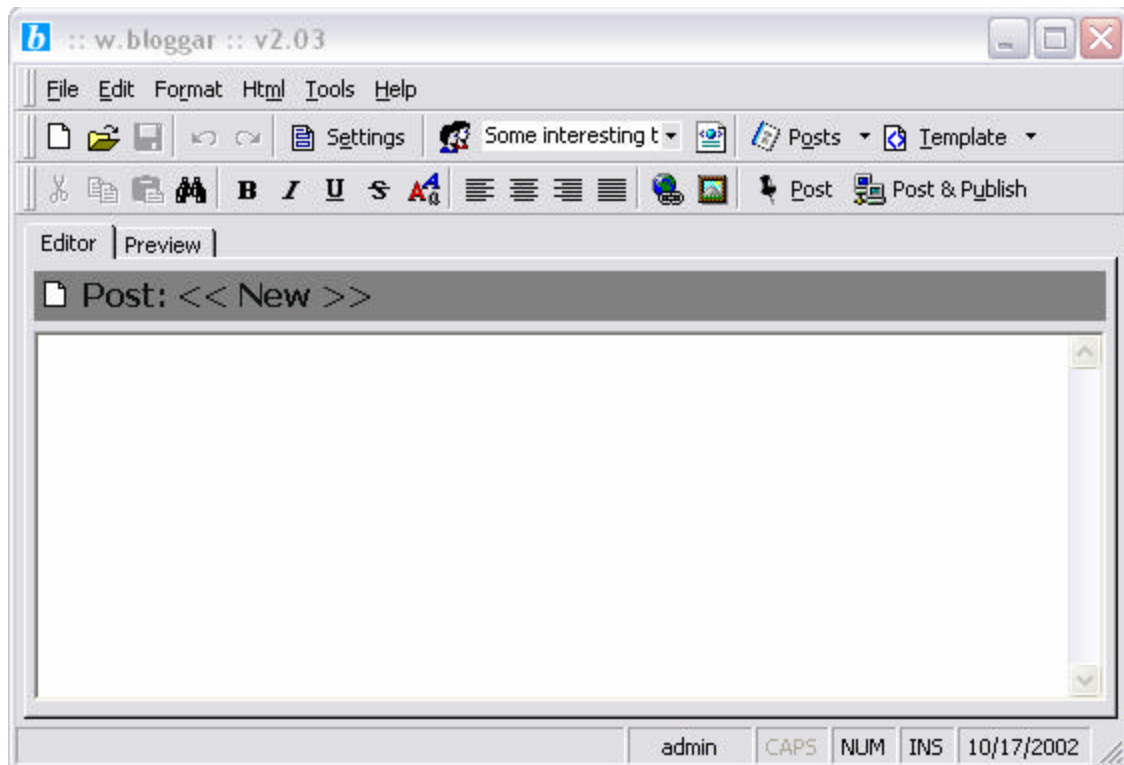

Now go to file->settings->account and you will see:

Click the reload blog list button to get a list of available blogs where you can post. Once the list is loaded from the server you are ready to use wBlogger.

## Using wBlogger

This is the main screen of wBlogger:

You can select the blog that will be used at the top (next to settings), you can send posts, edit posts, remove a post, preview posts and do anything that you want. Note that you can also store posts in your local disk and post them when you want. All in one wBlogger is an excellent companion to Tiki blogs that you can use to manage your blogs in any way that you want.

As an example select a blog, enter some text and post it, if everything goes fine you will see the post in your Tiki weblog (!!)

## The search engine

If the search feature is enabled and you assign the search box module to the left or right side bar you will see a search box where that you can use to search content in Tiki, the search box will display a select box allowing you to search for a word in:

- Wiki Pages
- Images
- Articles
- Image Galleries
- Blogs
- Blog posts

Once you select a feature and click the search button you will be redirected to the searchresults page :

### Search results:

Search in: [ [pages](#) | [galleries](#) | [images](#) | [blogs](#) | [blog posts](#) | [articles](#) ]

Found "a" in 2 pages

#### [HomePage](#) (11)

Hi everybody This is a link to MyFirstPage

Last modification date: Thursday 17 of October, 2002 [12:44:14]

#### [MyFirstPage](#) (2)

This is a test

Last modification date: Thursday 17 of October, 2002 [12:45:56]

Page: 1/1

In this screen you will see a list of results for the search, the links below the title can be used to search in different areas of Tiki such as pages, galleries, images, blogs, posts or articles. If there're a lot of results you will see links to the next/prev pages at the bottom, the number of items where the search criteria was found can be located just below the links to search different features.

This integrated search engine is very useful to quick-find content or information in Tiki and it will automatically detect which features/sections are enabled or disabled admitin the search only in enabled features. If you disable the Wiki for example you won't be able to find things in Wiki pages.

## Featured Links

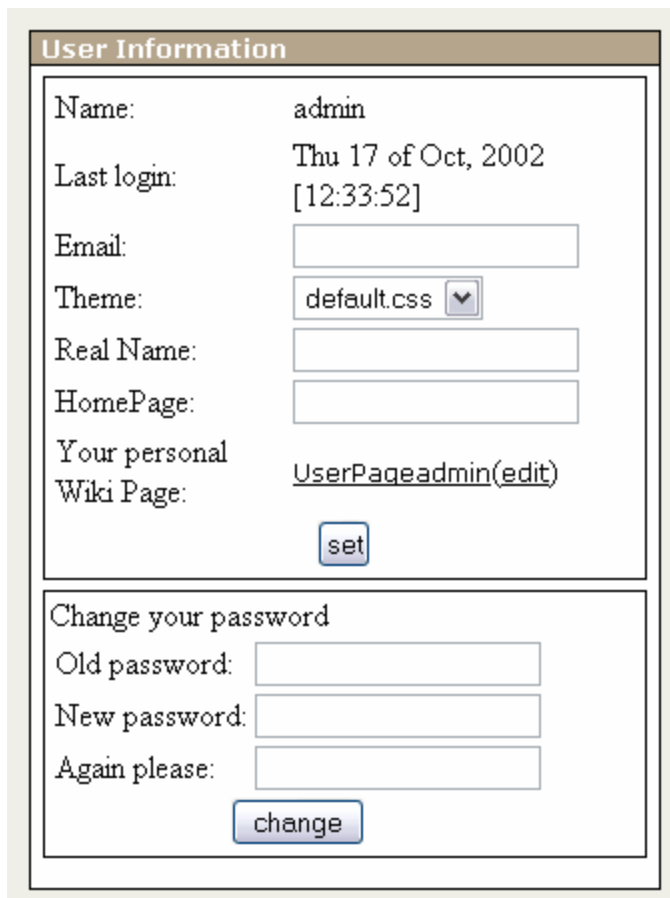

Featured links are links to sites/pages of special interest by the user community of the Wiki, when you click on a featured site link the site will be displayed as a Wiki page (as if it were framed). That's all, links to sites.

## The user preferences screen

If enabled from the admin menu you will see a link to “user preferences” in the main menu, the user preferences page is a page for registered users (users with a valid login and password already logged in the system) where they can set up several preferences about the site and where they can see some stats and quick links to pages, blogs or galleries they

have created.

A screenshot of a web form titled 'User Information'. The form contains several fields: 'Name:' with the value 'admin', 'Last login:' with the value 'Thu 17 of Oct, 2002 [12:33:52]', 'Email:' with an empty text box, 'Theme:' with a dropdown menu showing 'default.css', 'Real Name:' with an empty text box, 'HomePage:' with an empty text box, and 'Your personal Wiki Page:' with the value 'UserPageadmin(edit)'. There is a 'set' button below the Wiki Page field. Below this section is another section titled 'Change your password' with three text boxes for 'Old password:', 'New password:', and 'Again please:', followed by a 'change' button.

The user preferences will display a screen such as the one presented on the left, as you can see it has a box where the user can change his email, the theme, his real name, home page and it has a link to the user personal wiki page as well as a link to edit the page.

This screen can be used to set up different themes for users, in the future we plan to add a lot of themes, specially themes for users needing special accessibility features such as aural properties, bigger than normal text, absence of colors, etc.

This screen will be also enhanced with new preferences and setting in

future versions allowing the users to finer control how they use the site and how they make the site look.

## **Administration**

So you are the admin user, you are the one that can decide what other users can or can't do and how the application will be used by your users, Tiki allows a lot of flexibility that requires just a little reading.

Tiki can be configured to be a Wiki, a CMS system, a portal, a Weblog, many weblogs, a community site, a combination or whatever your imagination needs. Any configuration can be constructed using the admin screens and the permission system and while it is a very flexible and powerful system it can be learned in just a few minutes and it will be easy to use.

### ***Understanding users and groups***

The most important part of the Tiki administration is understanding the permission system used by Tiki, basically the rules are:

- Administrators can create and edit groups.
- Users can be assigned to one or several groups.
- Permissions are assigned to groups, NOT users.

There're two pre-defined groups:

- Anonymous : Users that are not logged automatically belong to the anonymous group.
- Registered group: Users logged in automatically belong to this group.

Tiki has the option to allow users to register themselves using the application or not, so registered users can or can't be trusted depending on that setting.

### **User administration**

The user administration screen allows you to administer users:

## Admin users

Find	<input type="text"/>	<input type="button" value="find"/>		
<b><u>name</u></b>	<b><u>email</u></b>	<b><u>last login</u></b>	<b>Groups</b>	<b>action</b>
admin		Thursday 17 of October, 2002 [12:33:52]	Anonymous	<a href="#">delete</a> <a href="#">assign group</a> <a href="#">view info</a>

Page: 1/1

### Add a new user

User:

Pass:

Again:

Email:

You can create new users (useful if users can't register themselves), you can remove users and you can assign groups to a particular users. You can find users by login name using the find button at the top of the listing (it will act as a filter)

## Group administration

The group administration screen is similar.

## Admin groups

Find	<input type="text"/>	<input type="button" value="find"/>	
name	desc	Permissions	action
Registered	Users logged into the system		<a href="#">delete</a> <a href="#">assign perms</a>
Anonymous	Public users not logged	tiki_p_submit_article(x) tiki_p_view(x)	<a href="#">delete</a> <a href="#">assign perms</a>

Page: 1/1

### Add a new group

Group:

Desc:

You can create groups, delete groups, find groups by name/description and you can assign permissions to a particular group clicking `assign_perms` in the row of the group. Note that by default the Registered and Anonymous groups are predefined.

### Assigning users to groups.

Create a group, for example test and create a user, for example foo, then from the user administration screen click `assign_groups` for the user. You will be able to assign groups to that particular user a user can belong to as many groups as you want.

### Assigning permissions to groups.

From the group administration screen click on `assign_perms` for a particular group and you will see a screen like this one:

## Assign permissions to group: Anonymous

### Group Information

**Name:** Anonymous  
**Desc:** Public users not logged  
**Permissions:** tiki\_p\_submit\_article(x) tiki\_p\_view(x)

Find	<input type="text"/>	<input type="button" value="find"/>
name	desc	action
tiki_p_view	Can view page/pages	<a href="#">assign</a>
tiki_p_use_HTML	Can use HTML in pages	<a href="#">assign</a>
tiki_p_upload_images	Can upload images	<a href="#">assign</a>
tiki_p_submit_article	Can submit articles	<a href="#">assign</a>
tiki_p_rollback	Can rollback pages	<a href="#">assign</a>
tiki_p_remove_submission	Can remove submissions	<a href="#">assign</a>
tiki_p_remove_article	Can remove articles	<a href="#">assign</a>
tiki_p_remove	Can remove	<a href="#">assign</a>
tiki_p_read_article	Can read articles	<a href="#">assign</a>
tiki_p_edit_submission	Can edit submissions	<a href="#">assign</a>
tiki_p_edit_article	Can edit articles	<a href="#">assign</a>
tiki_p_edit	Can edit pages	<a href="#">assign</a>
tiki_p_create_galleries	Can create image galleries	<a href="#">assign</a>
tiki_p_create_blogs	Can create a blog	<a href="#">assign</a>
tiki_p_blog_post	Can post to a blog	<a href="#">assign</a>
tiki_p_blog_admin	Can admin blogs	<a href="#">assign</a>
tiki_p_approve_submission	Can approve submissions	<a href="#">assign</a>
tiki_p_admin	Administrator, can manage users groups and permissions and all the weblog features	<a href="#">assign</a>

Page: 1/1

From this screen you will be able to add or remove permissions from a group.

When a user belongs to more than one group the permissions are accumulated.

### Permissions

Permissions are what groups CAN do, note that permissions always ALLOW groups to do things, there're no restrictive permissions in Tiki because they can conflict if the user has more than one group.

The list of permissions that you can assign to groups are:

## General permissions

Permission	Description
tiki_p_admin	Makes the group 'admin' admins can do everything. This can be used to have more than one admin in the Wiki (the user named 'admin' is automatically assigned to this permission)
tiki_p_use_HTML	Allows the user to use HTML when editing a page, article or submission. (doesn't give edit permission to the group)
tiki_p_edit_templates	Can edit templates (A missedited template may break the layout)
tiki_p_admin_banners	Can add/edit and remove banners
tiki_p_admin_dynamic	Can admin/edit the dynamic content system

## Wiki permissions

Permission	Description
tiki_p_view	Groups with this permission can visit and read the Wiki pages
tiki_p_rollback	Allows the group to rollback a page to any previous version
tiki_p_remove	Allows the group to remove pages and versions of pages
tiki_p_edit	Allows the group to edit Wiki pages
tiki_p_edit	Allows the group to edit Wiki pages

## Image gallery permissions

Permission	Description
tiki_p_create_galleries	Allows the group to create image galleries
tiki_p_upload_images	Allows users to upload images to their galleries or galleries that were created allowing other users to upload images

## Articles & Submissions permissions

Permission	Description
tiki_p_read_article	Can read articles, you should normally assign this permission to all the groups but if you want to charge for reading articles you may want to assign this permission only to the 'paid' (for example) group.
tiki_p_edit_article	Allow the group to edit articles
tiki_p_remove_article	Allow the group to remove articles
tiki_p_submit_article	Allow ythe group to send submissions.
tiki_p_edit_submission	Allow the group to edit/change submissions.
tiki_p_remove_submission	Allow the group to remove submissions.
tiki_p_approve_submission	Allow the group to approve submissions.

### Blog permissions

Permission	Description
tiki_p_create_blog	Groups with this permission can create new blogs.
tiki_p_blog_post	Can post to blogs created by them or public blogs.
tiki_p_blog_admin	Can admin blogs: edit/remove blogs that the user doesn't own.

### Permissions for individual users

What if you want to give a specific user some permissions? Just create an artificial group, assign the user to that group and give the group the permissions that you need.

### Exception: Permissions for individual wiki pages

The permission system explained above is what we call the GLOBAL permissions, if you are admin you can set INDIVIDUAL permissions for a page. You use the permissions button at the page bar. If the page has some individual permission then individual permissions apply, if not then global permissions apply. This is why a user that can edit pages may not be able to edit some particular pages. This is useful if you want only some users to be able to edit some pages on the Wiki, for example the home page, you can set individual permissions to the page and that will be that.

The permission system allows you to make Tiki behave as you want.

## ***The general administration panel***

The admin panel is where several settings about Tiki can be set, only users with admin permission can enter this screen, you can access it using the admin link from the Admin menu box.

This is Tiki v1.0 -Ras Algheti- (c) 2002 by Fwazonga Industries.

**Menu**

Image Galleries:	<input checked="" type="checkbox"/>
Featured links:	<input checked="" type="checkbox"/>
Hotwords:	<input checked="" type="checkbox"/>
User preferences screen:	<input type="checkbox"/>
Articles:	<input type="checkbox"/>
Submissions:	<input type="checkbox"/>
Blogs:	<input type="checkbox"/>
XMLRPC API:	<input type="checkbox"/>
Banners:	<input type="checkbox"/>
Edit templates:	<input type="checkbox"/>
Dynamic content system:	<input type="checkbox"/>

**General preferences and settings**

Index page:	Wiki
Users can register:	<input type="checkbox"/>

**Login**  
logged as: admin  
[Logout](#)

The admin panel is divided in sections which are:

- Features
- General preferences and settings
- Wiki settings
- Image Galleries settings
- CMS settings
- Blog settings

## **Features**

Features	
Wiki:	<input checked="" type="checkbox"/>
Search:	<input checked="" type="checkbox"/>
Image Galleries:	<input checked="" type="checkbox"/>
Featured links:	<input checked="" type="checkbox"/>
Hotwords:	<input checked="" type="checkbox"/>
User preferences screen:	<input type="checkbox"/>
Articles:	<input type="checkbox"/>
Submissions:	<input type="checkbox"/>
Blogs:	<input type="checkbox"/>
XMLRPC API:	<input type="checkbox"/>
Banners:	<input type="checkbox"/>
Edit templates:	<input type="checkbox"/>
Dynamic content system:	<input type="checkbox"/>

The features panel can be used to set-up which features will be enabled and which features will be disabled in the application. When you disable a feature all the screens and modules related to the feature will produce an error screen if accessed. This allows you to use Tiki for your needs without configuring the rest of the application if you don't want to.

The features are:

- Search: Enables/disables the search box and search results screen.
- Image galleries: enables/disables image galleries, gallery creation, image uploading, image rankings etc.
- Featured links: enables/disables featured links.
- Hotwords: enables/disables hotwords, when hotwords is enabled the Wiki pages are parsed and some words are automatically converted to links, if you have admin permissions you can edit this words from the admin hotwords screen.
- User preferences: enables/disables a screen where the users can setup their preferences, for example the theme.
- Articles: Enables disables articles.
- Submissions: Enables/disables submissions/
- Blogs: Enables disables blogs.
- XMLRPC API: Enables/disables the Blogger XMLRPC API that can be activated to allow Blogger compatible applications to manage tiki weblogs. Note that the API is carefully implemented to respect Tiki permissions so it is NOT a security compromise to enable this feature it is as safe as the rest of the site.
- Banners: Enables/disables the banner system

- Edit templates: Enables/disables dynamic template editing
- Dynamic content system: Enables/disables the dynamic content system

## General preferences and settings

Change admin password:

Again:

change

This panel controls settings and preferences generic to Tiki. The settings are explained below:

### *Index Page:*

This is a very interesting feature, with this setting you can select what to use as the Home Page of tiki, the Home page has the following properties:

- It's where you go if you click the "home" link in the main menu
- It's where you go after you log in
- It's where you go if you use <http://some.com/tiki/index.php> or <http://some.com/tiki/>
- It's where you go if you click the logo in the logo module.

You have 4 options for the home page:

- The wiki home page.

If selected then the home page will be the Wiki Page named HomePage.

- The Articles Home Page  
If selected the home page will be the articles home page where you can see the last “n” articles entered
- A Blog  
If selected then the home page will be a vweblog that you have to select in the weblog settings part of this screen. (if you don't set it or no blogs exist please don't select this option as the home page it will break the site)
- An Image gallery  
If selected the home page will be an image gallery that you can select in the Image galleries setting section of this screen, if you don't have any galleries please don't select this option because it won't work at all.

*Users can register:*

If turned on then the login box will display a “register” link when the user is not logged and the user will have the option to register using a webform.

*Open external links in a new window:*

If checked then links to external pages will be opened in a new window (please note that featuredLinks and hotwords links don't use this property. This property applies only to external links in wiki pages.

*Display modules to all groups always:*

In the admin modules screen when you assign a module to the left or right sidebar you can select which groups will be able to see the module. If this box is checked then modules will be always displayed to all users without considering their group. Use this feature if you are not interested in having modules that are displayed only to specific groups. (Note: The admin menu module is displayed only to admins)

*Use cache for external pages:*

If checked then Tiki will try to cache external links to make them available if the site goes offline or the page is changed. If you are running Tiki in an intranet or you don't want the cache feature you can disable the feature here.

*Use cache for external images:*

When this option is checked Tiki will download images, store them in the database and replace their URLs by a local one. This allows you to always have

images available even if they were taken from a external site and the site goes offline.

Note: You may need permission according to your local law to cache or download pages or images from external sites.

#### *Maximum number of versions for history:*

This option sets the maximum number of versions that will be stored for Wiki pages. This is a Wiki setting so it may be moved to the wiki settings panel in the next version.

#### *Maximum number of records in listings*

This option sets the maximum number of records that will be displayed in listings, there're several listings in Tiki, when the listing would show more than this number of rows then links to prev/next pages are displayed (pagination is used).

#### *Theme*

This option sets the theme of the application, please note that if the user preferences feature is enabled then users can choose their own theme overriding this setting.

#### *Language*

This option selects the language that the site will use.

### **Wiki settings**

Wiki settings

Dumps:

Dump: ☒  
Ranking: ☒  
History: ☒  
List pages: ☒  
Backlinks: ☒  
Like pages: ☒  
Rankings: ☒

This panel controls settings specific to the Wiki, there're three sections in this panel: Dumps, tags and Wiki Features.

#### Dumps:

In the Dumps section of the panel you can generate a dump for the wiki and you can also download the dump if you want.

#### Tags:

Create a tag for the current wiki

Tag Name

Restore the wiki

Tag Name

Remove a tag

Tag Name

A tag is a “mark” that you can create for the Wiki at any moment, when you create a tag all the current versions of the pages in the Wiki are marked under that name. Later you can restore all the pages in the Wiki to a specific state using the tag, for example you may want to tag your wiki before testing several features and then recover the state before the test. You can create a tag enetering a name and pressing the create tag button. You can also restore the Wiki to any tag using the restore button (selecting a tag first) and you can also select a tag

and remove it if you don't need it any more (tags uses some space in the database)

When you create a tag the pages are saved to a special table, they are not only "marked" so you can always recover a tag even if all the pages were removed using the remove feature and even if all the versions were removed too. The restore option will automatically recreate the pages from the versions saved under the tag.

## Features

Wiki Features:	
Sandbox:	<input checked="" type="checkbox"/>
Last changes:	<input checked="" type="checkbox"/>
Dump:	<input checked="" type="checkbox"/>
Ranking:	<input checked="" type="checkbox"/>
History:	<input checked="" type="checkbox"/>
List pages:	<input checked="" type="checkbox"/>
Backlinks:	<input checked="" type="checkbox"/>
Like pages:	<input checked="" type="checkbox"/>
Rankings:	<input checked="" type="checkbox"/>
<input type="button" value="Set features"/>	

In this section you can set which features will be enabled in the Wiki and which features won't be enabled.

## Image Galleries settings

Image galleries	
Home Gallery (main gallery)	
<input type="button" value="Set prefs"/>	
Test <input type="button" value="v"/>	
Galleries features	
Rankings:	<input checked="" type="checkbox"/>
<input type="button" value="Set features"/>	

There're two settings for image galleries, you can enable/disable rankings and you can select which is the Home gallery, the Home gallery will have the following properties:

- If not selected it will default to the first gallery created
- It's where you go if you click on galleries in the main menu (without expanding the menu)
- It's where you go as the home page if you select the home page to be a gallery (in the general settings)

## CMS settings

CMS settings	
CMS features	
Rankings:	<input checked="" type="checkbox"/>
<a href="#">Set features</a>	
Maximum number of articles in home: <input type="text" value="10"/>	
<a href="#">Change preferences</a>	

You can select here if the rankings feature is enabled for articles and submissions and you can also select the maximum number of articles to display in the articles home page.

## Blog settings

Blog settings	
Home Blog (main blog)	<input type="text" value="My Journal"/> ▼
<a href="#">Set prefs</a>	
Blog features	
Rankings:	<input checked="" type="checkbox"/>
<a href="#">Set features</a>	

There're two settings for blogs, you can enable/disable rankings and you can select which is the Home gallery, the Home gallery will have the following properties:

- If not selected it will default to the first blogcreated

- It's where you go if you click on blogs in the main menu (without expanding the menu)
- It's where you go as the home page if you select the home page to be a blog (in the general settings)

## Modules

Modules are the boxes you see in the left and right side bars of the application, modules can be configured to appear on the left or right bar and you can also configure the order in which modules appear. Finally you can create your own modules using HTML content and they will be ready to be placed as regular Tiki modules.

The modules are administered from the module administration screen:

This is Tiki v1.0 -Ras Algheti- (c) 2002 by Fwazonga Industries.

### Assign module

Module Name:   
Position:   
Order:   
Cache Time(secs):   
Rows:   
Groups:

**Login**  
logged as: admin  
[Logout](#)  
  
**Search**  
  
 in:

The screen is divided in 4 parts:

- User modules
- Assign modules
- Assigned modules
- Create/edit modules

## User modules

User modules are modules where the content can be anything you want. You can use text, you can use HTML code and you can also use “Smarty” templates special instructions, we’ll talk about these advanced options later.

First let’s see how to edit, remove and create user modules. This is the user module listing in the admin modules panel:

User Modules		
name	title	action
Foo	Bar	<a href="#">delete</a> <a href="#">edit</a>

This shows a list of user modules and you have the option to edit or delete a module, user modules are created or edited in this same screen at the bottom.

## Assign module

<b>Assign module</b>	
Module Name	<input type="text" value="Oso"/>
Position	<input type="text" value="left"/>
Order	<input type="text" value="1"/>
Cache Time(secs)	<input type="text" value="0"/>
Rows	<input type="text" value="10"/>
Groups	<div>Registered Anonymous</div>
	<input type="button" value="assign"/>

This is where you can assign a module to be displayed on the left or right side bar of the application, you have to select the module name, the position (left or right) and the order, modules will be displayed in an ascending order way so module 1 goes first then 2, etc. If two modules share the same order value they will be displayed in random order but never before a module with a lower number or before a module with a higher order.

Cache Time is the time that the module content can be in the cache (regardelss of this number some modules are never cached), if a module can be cached then

it will be refreshed after the indicated time passes. Use 0 if you don't want modules to be cached.

Rows are the maximum number of rows a module will display if that makes sense to the module, modules displaying rankings or listings will use this number.

Groups is used to select which groups will see the module if it is assigned. Note that if you don't select at list one group no one will be able to see the module. If more than one group is selected then the module will be displayed if the user belongs to ANY of the groups selected.

Note: There's a setting in the main admin panel called 'display modules to all groups always' when this setting is checked modules will be displayed always without examining the user group.

## **Assigned modules**

## Assigned Modules

### Left Modules

name	order	cache	rows	groups	action
logo	1	0	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
application_menu	2	0	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
admin_menu	3	5	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
Un pato	3	0	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
top_images	4	25	7		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
top_images_th	5	120			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
last_modif	6	120			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
top_pages	7	30	5		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
dada	19	200			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>

### Right Modules

name	order	cache	rows	groups	action
login_box	1	0			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
featured_links	2	30	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
Oso	3	0			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
prueb	4	120			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
search_box	5	0			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
top_galleries	6	120			<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
calendar	7	0	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
logged_users	8	0	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
last_galleries	9	60	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
user_pages	10	60	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>
user_galleries	11	1000	10		<a href="#">edit</a> <a href="#">up</a> <a href="#">down</a> <a href="#">x</a>

This part of the screen shows currently assigned modules and their order, cache, groups and number of rows. There're two tables, one for the modules at the left bar and other for the modules at the right bar. You can edit (assign) a module, remove it (it will only unassign the module, you can reassigned later) and you can also move the module up or down one position using the up/down links.

## Edit/Create user module

**Edit/Create user module**

Name

Title

Data

This allows the creation of a new user module, you need to indicate the name (used in the select box to assign the module), the title and the data that will be displayed, the data must be HTML (any since you are admin).

## Including dynamic content in user modules

You can include dynamic blocks in a user module using a simple syntax:

```
Today quote: {content id=3}
```

In the example we are including the current version of the dynamic block “3”. You can create/edit and program dynamic blocks using the Dynamic Content System (DCS). Read about the DCS in the DCS section to learn more.

## Including banners in user modules

If you want you can include a banner in a user module, using the following syntax:

```
{banner zone=sidebar}
```

Where zone must be the name of an existing zone in the banners system and there should be at least one banner assigned to the zone (or nothing will be displayed). You can learn more about banners in the banners section.

## Advanced editing

If you are not familiar with “Smarty” the template engine used by Tiki you should skip this section.

User modules are parsed by the Smarty template engine before being displayed, you may have noticed that dynamic content and banners are included using two special Tiki smarty plugins. So if you know about Smarty template editing you can use any Smarty tag in your user modules. You can do loops, if constructions, includes, etc.

If you want to learn about Smarty visit <http://smarty.php.net> you will find the Smarty documentation there that you can use in order to check out what can you use in your user modules.

## Available System Modules

Some modules are already defined by Tiki, this is the list of modules distributed with this version of tiki.

Module	Uses Rows?	Cache?	Description
Top Images	Y	Y	Most accessed images from the galleries listing the image name.
Top Images th	Y	Y	Most accessed images from the galleries listing the image thumbnail.
Last Galleries	Y	Y	Last modified galleries
Top Galleries	Y	Y	Most accessed galleries
Top Pages	Y	Y	Most accessed pages
Last Modified	Y	Y	Last modified pages
Login Box	N	N	The login box
Search Box	N	N	The search box. NOTE: You can give focus to the search box pressing ALT+s (Windows) or CTRL+s (Mac)
Logo Box	N	N	Logo box, shows the tiki logo linking to tiki-index.php
Featured Links	Y	Y	Featured links

## Special modules: The calendar module

The calendar module if enabled can be used to control some aspects of the Tiki application. First of all it is a normal calendar that can be navigated changing the month and year and you can always return to the day for today clicking the today link.

When you click on a day the calendar will mark it as the current day for the page you are viewing, if you change the page the calendar will go back to “today”.

### How the calendar affects articles

For the articles home only articles with a publishing date lower than the day selected in the calendar will be displayed, this can be used to see the articles home for any previous day. If the date is future and you are admin you can see future versions of the home using to-be-published articles. If you are not admin you won't see future articles.

### How the calendar affects blogs

For the blogs system any weblog will only display posts with dates equal or lower than the date selected in the calendar. If the date is future it is the same as today since we don't have posts with a future publishing date “yet” in the blogs system.

Note that once you select a date in the calendar it won't remain selected if you change the page you are viewing it will be restored to the current date.

## *Featured Links*

The featured links screen let's you enter links that will be displayed in the featured links module.

## Featured links

### List of featured links

url	title	action
<a href="http://www.google.com">http://www.google.com</a>	Google	<a href="#">delete</a>

### Add Featured Link

URL

Title

## *The cache*

Whenever Tiki finds a link to an external site in a Wiki page the link is cached in the Tiki cache, this allows the Wiki users to visit the page even if the site is offline or the page is removed or changed.

The “cache” option in the Admin menu lets you administer the Tiki cache:

## Cache

Find

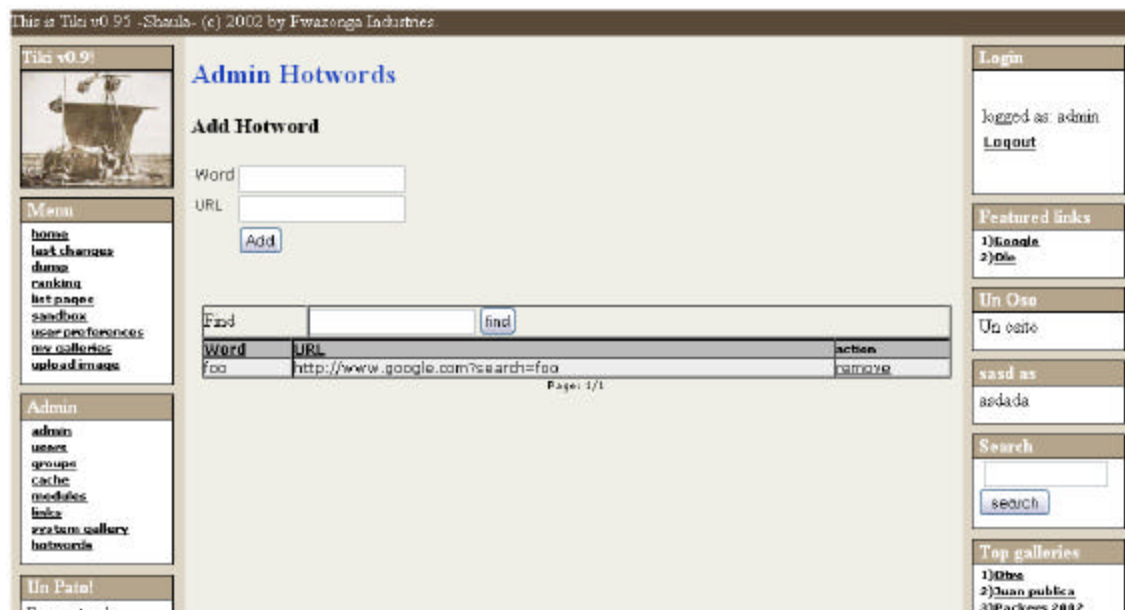

URL	Last updated	Action
<a href="http://www.yahoo.com">http://www.yahoo.com</a>	Thursday 17 of October, 2002 [16:14:04]	<a href="#">view cache</a> <a href="#">remove</a> <a href="#">refresh</a>

Page: 1/1

You can list the cached pages, find pages using the find button and for each cache entry you can view it, remove it, or refresh it (will retrieve a fresh copy of the page). If the entry is removed it will no longer display a “cache” link from the Wiki page where the site is referentiated.

## Hotwords

Hotwords is a feature that allows the admin to make some words in WikiPages appear as a link. If enabled as a feature hotwords can be administered from the hotwords administration screen:

Using this screen is simple, just add the word-link pairs as needed, remove them if you want, etc. The replacement will be case-insensitive if you add “PHP” you don’t need to add “php” as well. If you have a problem or don’t want this feature just disable it from the main admin screen.

## Edit templates

If enabled from the main admin screen you will see a link to “edit templates” in the admin menu.

If you want Tiki to be able to edit templates you must make sure that PHP can write to the the “templates” directory in the Tiki tree

Editing templates is a very powerful feature but it is dangerous too, if you miss-edit a template you may break the site layout and all your pages will display wrongly. We recommend you to use this feature with extreme caution and don't give the permission to edit templates to groups of users that are not careful.

The edit templates screen will display a list of templates:

This is Tiki v1.0 -Ras Algheti- (c) 2002 by Fwazonga Industries.

[Logout](#)

Save the template and check the result.

This feature can be used to make very nice changes or effects in your sites, for example you can include a logo at the top of the page editint the tiki.tpl template and you can change the logo on special occassions (as google does) editinh the template.

## **Banners**

If you have enabled banners from the admin menu you will see a link to admin banners in the admin menu. This will take you to the banner administration screen.

**Banners**

[Create banner](#)

Find

<u><b>Id</b></u>	<u><b>Client</b></u>	<u><b>Zone</b></u>	<u><b>Created</b></u>	<u><b>Method</b></u>	<u><b>Use Dates?</b></u>	<u><b>Max Impressions</b></u>	<u><b>Impressions</b></u>	<u><b>Clicks</b></u>	<u><b>Action</b></u>
No records found									

If you have permission to admin banners this screen will show you all the banners in the system with options to edit/remove/view each one. If you are a regular use this screen will display your banners with an option to view the banner stats for each one.

Note: There's no link in the main menu to the banner listing, you may want to provide your banner clients with a link to the banner listing screen by email or other method. (May be we should add a link in the main menu if the user is a client and has some active banner in a next version)

Since we won't have any banners initially let's click in the "create banner" link at below "Banners" to create a new banner.

## **Creating and editing banners**

## Edit or create banners

[List banners](#)

URL to link the banner:   
Client:  create zone:   
Max impressions:    
Zones:

Show the banner only between these dates:  
From date:     
To date:     
Use dates: ☐

Show the banner only in this hours:  
from:    
to:

Show the banner only on:  
Mon: ☒ Tue: ☒ Wed: ☒ Thu: ☒ Fri: ☒ Sat: ☒ Sun: ☒

Select ONE method for the banner

**Login**  
logged as: admin  
[Logout](#)

This is the form to create or edit banners, it's quite big so we are going to examine each section in detail to explain how to create different banners:

URL to link the banner:   
Client:  create zone:   
Max impressions:    
Zones:

In the first panel you have to indicate the URL where the banner will link, you have to select a client for the banner and you have to indicate the maximum number of

impressions for the banner and the zone where the banner will be used. If you have no zones you can create a zone using the "create zone" field and button on the right side.

What are zones?

Zones are sections of your site where banners will be displayed, for example we may want to set-up 3 different banners in our site, a normal "480x60" banner at the top of the screen, a text add in a user-module box and some button-like banner at the footer. Since we don't want a 480x60 banner being displayed in the textadd box we should set-up three different banner zones. You can name zones as you want, if you will only use normal/regular 480x60 banners at the top create a zone with any name and assign all your banners to that zone.

Later when displaying a banner in a Tiki template the syntax will make us indicate which zone will be used in that position.

For example create a zone “textadd” that will be used to put some textadds on the right side bar. After creating the zone you will be able to select the zone in the drop down.

Let’s examine the next panel

Show the banner only between these dates:

From date:

To date:

Use dates ☐

This box can be used to limit the banner lifetime to certain dates, you should enter when the banner will start to be active and when it will stop and check the

use dates checkbox in the panel. If use dates is not checked the banner will be active until it has run out of impressions (using the maximum number of impressions in the previous box). If use dates is active the banner will stop if it runs out of impressions or if the current date is not between the dates in this box. This panel is useful, for example to create a special banner for the holidays or a special date.

Show the banner only in this hours:

from:

to:

In this box you should select the hours when the banner will be active, for example you may want a banner to be displayed only at night or a banner to

be displayed between 3pm and 4pm to announce a sports event.

Show the banner only on:

Mon: ☒ Tue: ☒ Wed: ☒ Thu: ☒ Fri: ☒ Sat: ☒ Sun: ☒

This box can limit the weekdays where the banner will be displayed. You may have a banner

for Fridays, special banners for the weekends, etc.

Select ONE method for the banner

<input checked="" type="radio"/>	Use HTML HTML code: <div></div>
<input type="radio"/>	Use image Image: <input type="text"/> <input data-bbox="581 573 686 604" type="button" value="Browse..."/>
<input type="radio"/>	Use image generated by URL (the image will be requested at the URL for each impression) URL: <input type="text"/>
<input type="radio"/>	Use text Text: <div></div>

And finally here's where you actually indicate the banner. You have four different banner types and you must select only one to create the banner data. The options are:

- HTML banner
- Image banner
- Fixed URL banner
- Text banner

Each option will be explained as follows:

### HTML banners

HTML banners use a snippet of HTML code, this is very common for banner exchange sites where they will send you (show you) a portion of HTML code that you have to display in order to proceed with the banner exchange. Just paste/enter the HTML code in the text area and make sure the radio button is selecting HTML code to use HTML banners.

### Image banner

An image banner is just an image displayed as a banner linking to the URL you indicated. You should upload the image to be used for the banner. Use the upload box to upload the banner and make sure the radio button is pointing at the Use image option.

### Fixed URL banner

A fixed URL banner is a banner that will be retrieved from a URL, this is typical for dynamic "changing" banners, for example <http://bannerserver/mybanner?id=foo> or something like that. For this option you should enter the banner URL, each time the banner is selected to be displayed the content will be retrieved from the URL and displayed.

## Text banner

A text banner is just a snippet of text, this is known as “text adds” which are very common in sites such as Google or Kuro5hin.

For the example enter a couple of textadd banners in the textadd zone.

## Displaying banners

Once you have created your banners you want to display them, you can display a Tiki banner in any Tiki template including user modules system. You have to use the following syntax to include a banner in any template:

```
{banner zone=foo}
```

Where zone is the zone to be used.

In our example let’s create a user module from the user modules screen to display our textadds:

**Edit/Create user module**

Name

Title

Data 

```
{banner zone=textadd}
```

Once created assign the banner to some sidebar:

### Assign module

Module Name

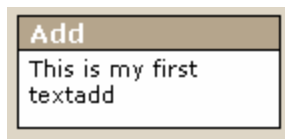

Position

Order

Cache Time(secs)

Rows

Groups

Now you should have a user module displaying the text add banners at the right side bar, refresh the screen to see how the banners are rotated (if you created more than one add). You now have textadds in your Tiki site just as Google or Kuro5hin!

## Viewing stats

Once banners are running you or your clients (friends) will want to check how they banners are doing in the Tiki system, from the banner listing you will see a link to “stats”.

### Banners

[Create banner](#)

Find

<u><b>Id</b></u>	<u><b>Client</b></u>	<u><b>Zone</b></u>	<u><b>Created</b></u>	<u><b>Method</b></u>	<u><b>Use Dates?</b></u>	<u><b>Max Impressions</b></u>	<u><b>Impressions</b></u>	<u><b>Clicks</b></u>	<u><b>Action</b></u>
2	admin	textadd	22 of Oct, 2002	useText	n	1000	3	0	<a href="#">Edit</a> <a href="#">Remove</a> <a href="#">Stats</a>
1	admin	textadd	22 of Oct, 2002	useText	n	1000	1	1	<a href="#">Edit</a> <a href="#">Remove</a> <a href="#">Stats</a>

Page 1/1

Clicking on “stats” will display the banner stats:

## Banner Information

Client:	admin
URL:	http://www.cnn.com
Zone:	textadd
Created:	22 of Oct, 2002
Max Impressions:	1000
Impressions:	
Clicks:	
Click ratio:	0.5
Method:	useText
Hours:	From: 00:00 to: 23:59
Weekdays:	mon tue wed thu fri sat sun

The banner information screen displays the statistics for the selected banner.

Future versions of Tiki will enhance the banner systems even more, new constraints will be added to the banner creation form (max impressions per week, restriction by group, etc) and new stats and graphics will be added to the stats page. New versions will be compatible with this version so you can start using the banners right now. Please let us know what would you add to the banners system to make it usable and we'll be happy to include our suggestions in a new version.

## ***Dynamic Content System***

The Dynamic Content System (DCS) is a very easy and flexible tool to display dynamic content in your Tiki sites/applications. This tool is very easy to use but somehow it's difficult to explain exactly what it is ☺.

The DCS lets you administer "blocks" and program "content" for those blocks. Later on you will be able to display any block in any Tiki template or user module.

First of all enable DCS from the main admin screen, you will now see a link to "admin content" at the end of the admin menu. Clicking on that link will take us to the DCS edit screen:

## **Creating and editing blocks**

# Dynamic content system

## Create or edit content block

[create new block](#)

Description:

save

## Available content blocks

Find	<input type="text"/>	<input type="button" value="find"/>				
<u>Id</u>	<u>Description</u>	Current version	Next version	Programmed versions	Old versions	Action
No records found						

Page 1/0

In this screen you can see a list of dynamic blocks, to create a block you just need to provide a description, for example create the “quote of the moment” block:

[create new block](#)

Description:

save

Once created you will see the block in the listing:

# Dynamic content system

## Create or edit content block

[create new block](#)

Description:

Quote of the moment

save

## Available content blocks

Find	<input type="text"/>	<input type="button" value="find"/>				
<u>Id</u>	<u>Description</u>	<u>Current version</u>	<u>Next version</u>	<u>Programmed versions</u>	<u>Old versions</u>	<u>Action</u>
2	Quote of the moment		Wed 31 of Dec, 1969 [21:00:01]	0	0	<a href="#">Remove</a> <a href="#">Edit desc</a> <a href="#">Program</a>

Page: 1/1

From the listing you can remove the block (all content if present will be removed as well), you can edit the block description (Edit desc) or you can program some content for the block. Let's click on "program" to add some content:

## Creating and editing content for a block

## Program dynamic content for block: 2

Block description: Quote of the moment

### Create or edit content

[\[create new block\]](#) [Return to block listing](#)

Description:

Publishing date    at

### Available content blocks

Find	<input type="text"/>	<input type="button" value="find"/>	
<u><b>Id</b></u>	<u><b>Publishing Date</b></u>	<u><b>Data</b></u>	<u><b>Action</b></u>
No records found			

Page 1/2

In this screen you will see a listing of all the programmed content for the block and you will be able to edit a content, create a new one remove content etc. Enter some quote using the default date (will be the current date)

## Program dynamic content for block: 2

Block description: Quote of the moment

### Create or edit content

You are editing block:3

[[create new block](#)] [[Return to block listing](#)]

Description:

This is my first quote

Publishing date: October 22 2002 at 13 31

### Available content blocks

Find	<input type="text"/>	<input type="button" value="find"/>	
<u>Id</u>	<u>Publishing Date</u>	<u>Data</u>	<u>Action</u>
3	Tue 22 of Oct, 2002 [13:31:00]	This is my first quote	<a href="#">Remove</a> <a href="#">Edit</a>

Page: 1 / 1

So you have some content for the block “2”. It’s very important to note the block number that you are editing at the top of the page.

## Displaying DCS blocks

You can display dynamic content blocks in any Tiki template or user block using the following syntax:

```
{content id=1}
```

Note: the ids may be different in your installation

Where the id is the id of the block (not the id of the block content!!).

Now let’s see how we can use the content in a user block.

Edit a user module as follows:

### Edit/Create user module

Name

Title

Data

```
{content id=2}
```

And assign it to the right sidebar.

### Assign module

Module Name

Position

Order

Cache Time(secs)

Rows

Groups

You wil now see the user module displaying the content you just entered in the DCS!

<b>Login</b>
logged as: admin <a href="#">Logout</a>
<b>Add</b>
This is my first textadd
<b>Search</b>
<input type="text"/> in: <input type="text" value="Wiki Pages"/> <input type="button" value="go"/>
<b>Quote</b>
This is my first quote

## Programming content

Now let's program some content for the future, go again to the Admin content screen, Click program for the block with the id=2 (or the id you receive when testing). Click on program and enter some data changing the date for 5 minutes ahead of the current time.

## Program dynamic content for block: 2

Block description: Quote of the moment

### Create or edit content

You are editing block:4

[\[create new block\]](#) [Return to block listing](#)

Description:

The new quote

Publishing date    at

### Available content blocks

Find	<input type="text"/>	<input type="button" value="find"/>	
<b>Id</b>	<b>Publishing Date</b>	<b>Data</b>	<b>Action</b>
4	Tue 22 of Oct, 2002 [13:41:00]	The new quote	<a href="#">Remove</a> <a href="#">Edit</a>
3	Tue 22 of Oct, 2002 [13:31:00]	This is my first quote	<a href="#">Remove</a> <a href="#">Edit</a>

Page: 1/1

Page: 1/1

The listing will show in a dark shadow the “current” content active for the block and in a lighter color the rows for “future” content or “old” content. As you can see we have a block displaying “The new quote” that will be displayed at 13:41. Now just wait until that time and refresh the screen, the user block on the right side bar will change!

Login

logged as: admin

[Logout](#)

Add

This is my first textadd

Wiki Pages

Quote

The new quote

This is how the DCS works, remember that you can display a dynamic block in any Tiki template not just user modules so you can design your site or design new pages for your Tiki-powered site including editable/dynamic/programmable blocks wherever you want.

You can use the DCS for whatever you want, you may want to display news, announcements, special notifications for special dates, sports results, messages to your site users, special offers, promotions, adds, etc.

The DCS system offers a lot of flexibility to your Tiki powered site, use it as you want and enjoy the results.

## **RSS feeds**

 RSS is an XML vocabulary for content syndication, basically RSS is used to provide a summary of a website, RSS feeds are used in news sites to syndicate the last news published, in publishing sites to list the last publications, in software/support sites to list the last releases in blogs to list the last posts etc. RSS is used by other sites to display what is happening in your site for example you may have seen the last articles in slashdot announced at other sites this is done requesting the slashdot RSS feed and using it in the site.

There're also a lot of desktop applications to pull RSS feeds from some sites and display the feeds in your windows desktop or similar.

Tiki provides 3 RSS feeds that you can use to syndicate your website content:

- The Wiki RSS feed
- The articles RSS feed
- The Blog RSS feed

### ***The Wiki RSS feed***

Tiki provides an RSS feed listing the last changes made to the Wiki, the RSS feed can be accessed using the URL [http://yoursite.com/tiki/tiki-wiki\\_rss.php](http://yoursite.com/tiki/tiki-wiki_rss.php), or by clicking the RSS button at the footer of the pages.

The feed can be used to display the last changes to your site in other sites or applications.

### ***The Articles RSS feed***

The Articles RSS feed is the most common RSS feed found in CMS systems, it lists the last 10 articles in the system, the URL for this RSS feed is: [http://yoursite.com/tiki/tiki-articles\\_rss.php](http://yoursite.com/tiki/tiki-articles_rss.php)

### ***The Blogs RSS feed***

The Blogs RSS feed can be used to get the last 10 posts for some given Blog, the php script generating the feed “must” get the blogId as a parameter. The URL is like: [http://yoursite.com/tiki/tiki-blog\\_rss?blogId=1](http://yoursite.com/tiki/tiki-blog_rss?blogId=1) which will give you the last 10 posts in the blog with id=1.

## **Customizing the application (Tiki for programmers)**

Tiki is an application designed to grow in a neat and usable way, there are several features that allow this application to be easily enhanced and customized by programmers.

- Smarty (the template engine) is used to separate content from presentation, all the logic is in the foo.php files and there's a foo.tpl file that contains the template used to display what the php file generates.
- The whole layout of the application is present in only one file: tiki.tpl (the main template) so you can change the layout as you want by changing just this file
- CSS is used to define the presentation properties of all the elements in the Tiki pages, themes are defined creating new CSS files and putting them in the CSS directory.
- All the database-accessing functions are in library files in the lib directory as classes, the code in PHP files access/changes entities by calling the Tiki API. If you code new pages/modules/whatever please respect this, thanks!
- Tiki is really easy to customize/extend, please give it a chance!

### ***Style, themes and look and feel***

The look and feel and style of tiki is defined in CSS files, each CSS file defines a particular theme, you can copy a CSS file and change it to create a new theme, the CSS files are self-documented so you will know what are you changing when you edit it. If you think you can improve the CSS files or document them better please do it!

## ***Internationalization and languages***

Tiki supports multiple languages and defines a mechanism to easily make the application available in other languages. In the PHP scripts all the strings must be written as `tra("here goes the string")`; calling the "tra" function that translates the string. In templates you should use the Smarty `{tr}` block, for example `{tr}Hello world{/tr}`. This is how you write string in Tiki to be language-aware.

Once you have modified Tiki the "get\_strings.php" script can be used to scan all the .php and .tpl files in the application regenerating/changing the language files. New strings are added to language files untranslated.

### **Creating a new language (this is easy!)**

1. Create a new directory under the "lang" directory, please name it using a 2 letter convention, example: en=english, sp=spanish.
2. Copy a language file from some other language that you are familiar to this directory.
3. Edit/translate the language.php file.
4. The language is ready to use from Tiki (Tiki will automatically detect the new language)

When testing new languages keep in mind that modules can be cached so they may not change their language unless you clear the cache (in the module administration screen you have an option to clear the cache)

## ***Adding new features to Tiki***

If you want to use Tiki to build your site or your application or if you want to join the Tiki developers community this is what you want to read.

Tiki is an application environment designed to be extensible and customizable, if you know PHP and want to extend Tiki this section will explain how to create new features for Tiki.

### **Basic rules**

Let's start with the basic rules:

Rule 0 (Zeroth): Everybody is welcome to the Tiki developers community, if you need help ask if you want to try try, if you want us to review your work send it.

1. Tiki pages are always compounded by two files: a php file and a template. All the logic and PHP code goes in the PHP file and all the presentation, displaying and layout goes to the template.
2. All the database-access functionality is abstracted into libraries in the lib directory, tikilib is the system library for tiki core modules.
3. PEAR is used in libraries and only in libraries to access the databases, direct DBMS functions such as MySQL API functions are not used.
4. All the strings are written to be easily translated using the “tra” function in PHP or the {tr}/{tr} blocks in templates.
5. All your HTML code must be XHTML 1.0 transitional compatible, use the W3C validator to check your module before releasing it.
6. Put style to your XHTML code using CSS stylesheets.
7. Everything must work with all the warnings and errors reported
8. Everything must work if register\_globals is turned off

## **Tutorial: adding a graffiti wall to Tiki**

Now as a tutorial let's imagine that we want to write a new feature to Tiki called “graffiti wall”, the graffiti wall will display the last “n” graffiti (configurable) and will provide users with a simple text area where a graffiti can be entered. HTML code will not be allowed.

### **Planning our module**

We'll need one screen for the graffiti wall:

- tiki-graffiti : Display the last “n” graffiti and provide a form to enter a new graffiti.

The screen will be compounded by:

tiki-graffiti.php : PHP code  
tiki-graffiti.tpl : Template

We'll also add a new library to Tiki called ‘graffitilib.php’ in the lib directory.

Since we need to store graffiti somewhere we have to create a table to store graffiti, we'll write the .sql creation script in a file called graffiti.sql this will be our table:

```
drop table if exists tiki_graffittis;
create table tiki_graffittis (
  graffitiId integer(12) not null auto_increment,
  data text,
  timestamp integer(14),
  primary key(graffitiId)
);
```

Note: Timestamps and dates are stored in tiki tables as Unix timestamps and are represented as 14 digit long integers. Please use this format to keep the tables consistent.

Execute the .sql script using for example

```
mysql tiki < graffiti.sql
```

## The library

Now we'll write the library that will be used to access the graffiti table, we'll call the library graffitiLib.php and it will be a class where we'll encapsulate all the functions that will be used to display graffiti.

This is the library:

```
<?
class GraffitiLib {
  var $db;    // The PEAR db object used to access the
  database

  function GraffitiLib($db)
  {
    if(!$db) {
      die("Invalid db object passed to UsersLib
constructor");
    }
    $this->db = $db;
  }

  function sql_error($query, $result)
  {
    trigger_error("MYSQL error: ".$result->getMessage().
in query:<br/>".$query."<br/>",E_USER_WARNING);
    die;
  }
}
```

```

function add_graffitti($data)
{
    $data = addslashes(strip_tags($data));
    $now = date("U");
    $query = "insert into tiki_graffittis(data,timestamp)
values('$data',$now)";
    $result = $this->db->query($query);
    if(DB::isError($result)) $this->sql_error($query,
$result);
    return true;
}

function get_graffittis($n)
{
    $query = "select * from tiki_graffittis order by
timestamp desc limit 0,$n";
    $result = $this->db->query($query);
    if(DB::isError($result)) $this->sql_error($query,
$result);
    $ret = Array();
    while($res = $result->fetchRow(DB_FETCHMODE_ASSOC)) {
        $ret[] = $res;
    }
    return $ret;
}
}

?>

```

The form in which this class was written should be followed by all the libraries used in Tiki.

The class constructor receives a pear connection object used to access the database through PEAR in the class, we added a method to display SQL errors and two application methods: `add_graffitti($data)` that will be used to add a new graffiti and `get_graffittis($n)` that will return an array with the last “n” graffiti.

Writing skeletons and putting all together

Now put `graffittilib.php` in the lib directory.

Create `tiki-graffitti.php` in the main tiki directory and write the following skeleton:

```

<?
require_once('tiki-setup.php');

```

```
require_once('lib/graffittilib.php');
$glib = new GraffitiLib($dbTiki);
$smarty->assign('mid','tiki-graffitti.tpl');
$smarty->display('tiki.tpl');
?>
```

Let's examine the code, tiki-setup is a php file that MUST be included in all the Tiki scripts, in that file permissions and preferences are loaded the database connection is established, the session is checked to determine if the user is logged etc. Don't forget to include it in your Tiki modules.

Then we included our library from the lib directory.

After including the lib we create a GraffitiLib object passing the global variable \$dbTiki that contains the default database connection as indicated in db/tiki-db.php.

Finally we set-up the template to use in the middle area of Tiki and we display the template tiki.tpl.

Create the skeleton layout tiki-graffitti.tpl and put it in the templates directory.

```
<h1>Graffittis</h1>
```

Just a title since the templates are normal HTML code mixed with Smarty directives.

Now check if everything is ready to be filled in by accessing tiki-graffiti.php from a browser:

Wow! The tile is displayed and we are ready to code our Graffiti module.

If you are an experienced PHP developer and know Smarty this is all you need to start coding new features for Tiki, if you need help or have questions you are free to ask, subscribe to [tiki-devel](mailto:tiki-devel@lists.sourceforge.net) the Tiki developers mailing list and start coding. (You can subscribe to the mailing list from the sourceforge page: <http://tikiwiki.sourceforge.net>)

If you want to learn more and learn how to code the Graffiti module just keep reading!

## Coding the graffiti module

Now, we have the skeleton ready to be filled in, we'll start by adding a form to the template to enter new graffiti.

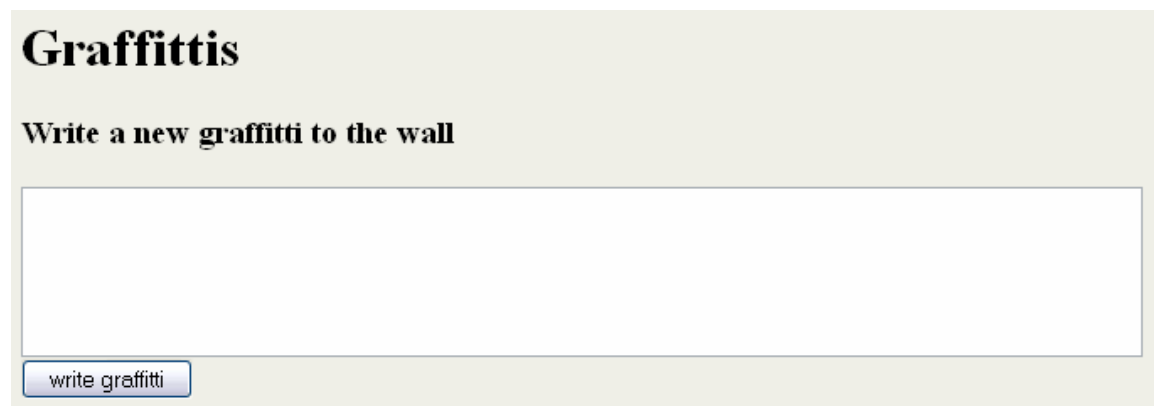

This is tiki-graffiti.tpl with the form.

```
<h1>Graffittis</h1>
<h3>Write a new graffiti to the wall</h3>
<form method="post" action="tiki-graffitti.php">
  <textarea name="data" rows="5" cols="80"></textarea>
  <input type="submit" name="send" value="{tr}write
graffitti{/tr}" />
</form>
```

Very important notes:

- Forms usually are processed by the same script that displayed the template containing the form, in this example tiki-graffitti.php
- XHTML should be used note how the <input> tag ends with “/”
- The {tr}/{tr} smarty block must be used to escape strings that can be translated to different languages.

And this is displayed if you access tiki-graffitti.php

The screenshot shows a web page with a light beige background. At the top, the word "Graffittis" is written in a large, bold, black serif font. Below it, the text "Write a new graffiti to the wall" is displayed in a smaller, bold, black serif font. Underneath this text is a large, empty rectangular text input field with a thin grey border. At the bottom left of the page, there is a small, rectangular button with a blue gradient and the text "write graffiti" in a small, black, sans-serif font.

Now we are ready to process the addition of a new graffiti to the wall, let's go to tiki-graffitti.php and add the code to process an addition.

```

<?
require_once('tiki-setup.php');
require_once('lib/graffittilib.php');

$glib = new GraffitiLib($dbTiki);

if(isset($_REQUEST["send"])) {
    $glib->add_graffitti($_REQUEST["data"]);
}

$smarty->assign('mid','tiki-graffitti.tpl');
$smarty->display('tiki.tpl');
?>

```

Note how `$_REQUEST` is used to access submitted variables, this is to make sure that the script will work in PHP installations where `register_globals` is turned off. It's very important to respect this in your Tiki modules.

The code is easy if we are processing a submit button named “send” then call the `add_graffitti` method in our library to add the graffiti.

So now you can add graffiti's but you can't see them!, let's add some code to get the list of graffiti's from the database. Add this before the code that processes the form in `tiki-graffitti.php`

```

$graffittis = $glib->get_graffittis(10);
$smarty->assign_by_ref('graffittis',$graffittis);

```

This gets the last 10 graffiti's from the database and assigns them to a smarty template variable called ‘graffittis’ now we have to display the graffiti's in the template. Edit `tiki-graffitti.tpl`

```

<h1>Graffiti's</h1>
<h3>Write a new graffiti to the wall</h3>
<form method="post" action="tiki-graffitti.php">
    <textarea name="data" rows="5" cols="80"></textarea>
    <input type="submit" name="send" value="{tr}write graffiti{/tr}" />
</form>
<h3>Last graffiti's</h3>
{section name=i loop=$graffittis}
<div class="simplebox">
    {$graffittis[i].data}
</div>
{/section}

```

Note how the Smarty {section} directive is used to loop the \$graffittis template variable assigned in the PHP file, for each graffiti we display the data in a div classed 'simplebox' the result is simple:

## Graffittis

Write a new graffiti to the wall

write graffiti

### Last graffittis

tt

nv

daads

daads

Write graffittis and see them appearing at the top, once you reach more than 10 only the last 10 graffittis will be displayed.

### Adding the graffiti module as a tiki feature.

Once you have a successful module doing everything you want you should add it as a Tiki feature allowing the admin to enable/disable the new feature from the Tiki main screen menu.

In order to do this you must edit tiki-admin.tpl and tiki-admin.php, in tiki-admin.tpl add a checkbox with a name proper to your module example: \$feature\_graffittis, you can copy-paste-edit the code for another feature. In tiki-admin.php add the code to process the new checkbox, you can copy the code used to process the checkbox for another feature. Once you did this work you will be able to use something like this in tiki-graffitti.php

```
if($feature_graffittis != 'y') {  
    $smarty->assign('msg',tra("This feature is disabled"));  
    $smarty->display('error.tpl');  
    die;  
}
```

Note how the error template is called with an error message, note also the use of the “tra” PHP function to translate the error message string.

There’re many improvements to this module, purging all graffittis, removing graffittis if you are admin, displaying the date along with the graffiti. Etc... Since the module is just an example we’ll leave it as is and you can code more if you want.

This was an introduction to the Tiki development world, we strongly hope you like the application and the way in which new features are coded. If you have complaints, suggestions or want to help just contact us.

## Appendix A: List of application templates

### Wiki Templates

Name	Description
error.tpl	Error template, displays the layout and an error message.
tiki.tpl	Main template all non-error pages use this template, the mid area of the template is replaced by another template depending of the page.
tiki-admin.tpl	Administration screen
tiki-admin_links.tpl	Featured links administration
tiki-admin_modules.tpl	Module administration
tiki-admingroups.tpl	Group administration
tiki-adminusers.tpl	User administration
tiki-assignpermission.tpl	Assign permission to a group
tiki-assignuser.tpl	Assign a user to a group
tiki-backlinks.tpl	Displays backlinks to a page
tiki-bot_bar.tpl	Footer
tiki-browse_gallery.tpl	Browse gallery
tiki-browse_image.tpl	Browse an image
tiki-editpage.tpl	Edit a page
tiki-featured_link.tpl	Displays a featured link
tiki-galleries.tpl	Admin galleries (not only admins)
tiki-lastchanges.tpl	Last changes to the wiki
tiki-likepages.tpl	Shows pages similar to the current page
tiki-list_cache.tpl	Lists the cache
tiki-list_gallery.tpl	Lists a gallery (non-graphical browsing)
tiki-listpages.tpl	List pages

tiki-page_bar.tpl	Page menu (history,lock,etc)
tiki-pagehistory.tpl	Displays page history
tiki-pagepermissions.tpl	Assign permissions to a page
tiki-preview.tpl	Preview of a page
tiki-print.tpl	Printable version of a page
tiki-register.tpl	Register a new user
tiki-tanking.tpl	Ranking of pages
tiki-removepage.tpl	Remove a page
tiki-rollback.tpl	Rollback a page
tiki-searchresults.tpl	Displays search results
tiki-show_page.tpl	Shows a wiki-page (used in other templates)
tiki-top_bar.tpl	Header
tiki-upload_image.tpl	Upload an image
tiki-view_cache.tpl	View a cached page
tiki-admin-hotwords.tpl	Admin hotwords
tiki-user_preferences.tpl	User preferences screen
tiki-edit_article.tpl	Create new articles or edit existing articles
tiki-view_articles.tpl	Articles Home page, displays last "n" articles
tiki-read_article.tpl	Read an article
tiki-list_articles.tpl	List articles, links to remove/edt/read
tiki-preview_article.tpl	Preview an article (used in edit_article)
tiki-edit_submission.tpl	Create/edit a submission
tiki-list_submissions.tpl	List submissions, links to edit, remove, view, approve them
tiki-edit_blog.tpl	Create a new blog or edit an existing blog
tiki-blog_post.tpl	Post in a blog
tiki-view_blog.tpl	Read a blog (show posts in a blog)
